ALM System Requirements

As a prerequisite to installing Performance Center components, you must install Micro Focus Application Lifecycle Management (ALM).

For ALM system requirements, see the System Requirements guide available from the [ALM Help Center](#).

Cloud Computing - Amazon AWS

LoadRunner and Performance Center are certified to be installed and run under Amazon Web Services (AWS), using a BYOL (Bring Your Own License) model.

Requirements for deploying LoadRunner or Performance Center on AWS:

- All components of the cloud computing environment follow the system requirements specified in this document. For the AWS requirements for ALM (Performance Center only), see the ALM System Requirements guide available from the [ALM Help Center](#).
- The required ports are open for communication. For the required ports, see [Load Generators on the Cloud](#) in the LoadRunner help, and Communications Paths in the [Performance Center Installation Guide](#).

Note:

- Cloud load generators can be provisioned using the built-in functionality of LoadRunner or Performance Center. For details, see [Manage Load Generators on the Cloud](#) in the LoadRunner help and [Provision Cloud load generators](#) in the Performance Center help. All other components must be manually installed and configured by the user
- To improve performance, it is preferable to deploy the ALM server, Performance Center server and hosts, and the database in the same region. Consult AWS for best practices about network performance.
- Cloud load generator ports are configurable. When all the components are in the cloud, the ports to use are defined by the cloud provider (they are not based on internal IT policies).
