# Welcome to this guide

This OpenText<sup>™</sup> guide describes how to install and set up LoadRunner Enterprise.

LoadRunner Enterprise is a cross-enterprise tool for planning and running multiple performance test projects across different geographic locations. Using LoadRunner Enterprise, you can stress your applications to isolate and identify potential client, network, and server bottlenecks.

**Note:** If your organization has firewall restrictions that prevent you from using the online Help Center, you can download and deploy the Help Center on your local server. For details, see the **Download Help Center** instructions in the LoadRunner Enterprise Help Center.

## Installation overview

## Before you install

This chapter provides information to prepare you for the LoadRunner Enterprise component installations.

This chapter includes:

Components and data flow	10
System component considerations	22
Windows system locale considerations	25
Required services	
Pre-installation prerequisites and considerations	27
Database prerequisites	
Installation package details	

### Components and data flow

This section describes the LoadRunner Enterprise system.

This section includes:

- "Architecture and components" on the next page
- "Applications " on page 13
- "Communication paths" on page 14
- "Load considerations" on page 18
- "Distributed Denial of Service attack protection" on page 20
- "Clustered configuration" on page 20

### Architecture and components

This section describes the architecture and components of LoadRunner Enterprise.

Architecture/Component	Description
Database server	The database server stores four types of schemas:
	• Site Management schema. Stores information related to each tenant in the system, including users and site management tasks. A row exists in this schema for each tenant you create.
	• Site Administration schema. Stores information related to the LoadRunner Enterprise system, such as domains, users, and site parameters. A row exists in this schema for each project you create. Irrespective of how you configure your system, there is always only one Site Administration schema.
	• Lab Management. Stores lab information related to managing lab resources, such as hosts and host pools, and for managing LoadRunner Enterprise assets, such as LoadRunner Enterprise server, licenses, and usage reports. There is always only one Lab Management schema.
	<ul> <li>Project schemas. Stores project information, such as entity data and user data. A separate schema exists for every project you create.</li> </ul>
	The schemas can reside on an Oracle, Microsoft SQL, or PostgreSQL server.
	<b>Note:</b> To improve system performance, it is advisable that the LoadRunner Enterprise server and the Database server be installed on separate machines and be connected over LAN.

Installation Guide

Installation overview

Architecture/Component	Description
Project repository	Stores all files to be used by all the projects in the system. For example, scripts, run results, .xml files, templates, and attachments. By default the repository is located on the same machine as the application server, which is useful for smaller setups. For larger organizations however, or when working in a clustered environment, it is advisable to install the repository on a dedicated machine. When working in a clustered environment, the repository must be accessible by all nodes.
LoadRunner Enterprise Server	Hosts the LoadRunner Enterprise Web pages that enable you to design performance tests, configure monitors, reserve testing resources, run and monitor test runs, and analyze test results.
LoadRunner Enterprise Administration	The center for managing lab resources, such as hosts and host pools, and for managing LoadRunner Enterprise assets, such as LoadRunner Enterprise servers, licenses, projects, runs, timeslots, and system usage reports.
	Also used for managing cloud settings when using cloud hosts in LoadRunner Enterprise, and automated maintenance of the system's key components to detect system failures.

Description
Used to control performance tests, generate load, and analyze data. LoadRunner Enterprise hosts can be configured as Controllers, load generators, or data processors:
• <b>Controller.</b> The manager of a performance test. The Controller receives scripts, runtime settings, and a list of load generators to use. The Controller issues instructions to the load generators including which scripts to run, how many Vusers to run per script, and scheduler settings. At the conclusion of the test run, the Controller collates the data. There is only one Controller per performance test.
<ul> <li>Load Generator. Generates load by running virtual users, otherwise known as Vusers. The Controller dictates the manner in which they start and stop running. There can be any number of load generators for a test.</li> <li>Data Processor. Used for analyzing and publishing performance test results.</li> </ul>

### Applications

The following standalone applications integrate with your LoadRunner Enterprise system:

Application	Description
Analysis	Provides graphs and reports with in-depth performance analysis information. Using these graphs and reports, you can pinpoint and identify the bottlenecks in your application and determine what changes need to be made to your system to improve its performance.
MI Listener	Needed when running Vusers and monitoring applications over a firewall.
Monitors Over Firewall Agent	Used to monitor servers that are located over a firewall.

Application	Description
OneLG	A combined (standalone) load generator installer for all of the LoadRunner family products.
Virtual User Generator (VuGen)	Generates Vusers by recording actions that typical end-users would perform on your application. VuGen records your actions into automated Vuser scripts which form the foundation of your performance tests.

Use the diagram and table in the "Communication paths" below and "Load considerations" on page 18 sections to determine which machines to allocate for which performance testing tasks.

For example, you can combine a number of applications that have a light load on a single machine. For details on which standalone applications can be installed together, see the Support Matrix (System Requirements) in the LoadRunner Enterprise Help Center.

For information on installing the standalone applications, see "Install standalone components" on page 89.

### Communication paths

When installing LoadRunner Enterprise, it is important to consider the communication paths between the components, and their resource demands.

When running a performance test, components share information with LoadRunner Enterprise using a distinct system of communication. Understanding which components communicate with one another and the method of communication is essential for configuring your system. The following diagram illustrates the LoadRunner Enterprise communication paths in an advanced deployment:

#### Note:

- To view other deployment options that can be used for configuring LoadRunner Enterprise on-premises or on the cloud, see LoadRunner Enterprise Deployments in the LoadRunner Enterprise Help Center.
- If the installation cannot use a default port because it is already in use, you can change the port. For details, see "Unable to install a LRE component if the default port is in use" on page 182.
- You cannot have a firewall between the LoadRunner Enterprise server, LoadRunner Enterprise hosts (used as Controllers), and MI Listener.
- Port 8182 from LoadRunner Enterprise host to load generators is relevant when running NV emulation for viewing NV related graphs during online. If

- the port is closed, graphs are still available in the offline results and Analysis report.
  - Connections from APM tools to the AUT are not displayed in the diagram. Each AUT tool uses its own ports, which can be found in the corresponding product's documentation.
  - When using a load balancer for LoadRunner Enterprise servers:
    - The load balancer needs to be configured for sticky sessions based on the HTTP cookie **ASP.Net\_SessionId**.
    - You need to configure WebSocket on the load balancer. However, if you have SSL configured on the load balancer only (and not on LoadRunner Enterprise servers), you need to terminate SSL for WebSocket on the load balancer.

The following table displays the connection ports that must be opened for incoming traffic on LoadRunner Enterprise components:

Component	Ports
LoadRunner Enterprise Server	HTTP: 80* **

#### Installation Guide Installation overview

Component	Ports
LoadRunner Enterprise Host	HTTP: 8731
	TCP: 3333, 54245, 54345
	8182 for LoadRunner Enterprise hosts used as Load Generators to see online graphs for NV emulation information. If the port is closed, you can still see NV information in the offline results.
	8731 for LoadRunner Enterprise server to communicate with the Load Testing Operator service that orchestrates the test.
	8086 for LoadRunner Enterprise server/host to get online/offline analysis data. The port must be open for outgoing communication from the LoadRunner Enterprise server, and for incoming communication for the LoadRunner Enterprise host (for an internal database). For an external database, the port must be open for both incoming and outgoing communication from the LoadRunner Enterprise server and LoadRunner Enterprise host.
	54345 for LoadRunner Agent Service. Enables the Controller to connect to this host when it acts as a Load Generator.
	54245 for LoadRunner Remote Management Agent Service. Enables LoadRunner Enterprise server to perform lab maintenance operations on this host.
	3333 for LoadRunner Data Collection Agent. Enables LoadRunner Enterprise to control the machine routing table during a test run, based on the definitions set in Target IPs in the project settings. It also enables getting resource utilization metrics while a test is running.
Database	TCP:
	<ul> <li>1433 (Microsoft SQL)</li> <li>1521 (Oracle**)</li> <li>5432 (PostgreSQL**)</li> </ul>
Repository	NetBIOS
Standalone	TCP: 54245, 54345
Load Generator	8182 to see online graphs for NV emulation information. If the port is closed, you can still see NV information in the offline results.

Component	Ports
Cloud-based Load Generator	As defined in the Cloud Network Settings dialog box. For details, see Initial cloud settings in the LoadRunner Enterprise Help Center.
<b>MI Listener</b>	HTTP/TCP (load generator only): 443**
	TCP (LRE server, host used as a Controller only): 50500
SiteScope - Monitor Profiles	HTTP: 8888*

\* HTTPS is also supported on this component.

\*\* Default values that can be changed during configuration.

### Load considerations

The following table provides some basic installation considerations for each LoadRunner Enterprise component:

LoadRunnerAt least one.Heavy load.EnterpriseAlso supportsTo balance the load, you can install and	Machine	Quantity in the system	Load Considerations
Enterprise	LoadRunner Enterprise Server	At least one.	Heavy load.
Server cluster configuration. For details, see "Clustered configuration" on page 20. Configuration and the load, you can install and configure external load balancers to work with LoadRunner Enterprise. For additional load balancing support, you can install and configure external load balancers to work with LoadRunner Enterprise. For additional load balancing support, you can install multiple LoadRunner Enterprise servers		Also supports cluster configuration. For details, see "Clustered configuration" on page 20.	To balance the load, you can install and configure external load balancers to work with LoadRunner Enterprise. For additional load balancing support, you can install multiple LoadRunner Enterprise servers.

Machine	Quantity in the system	Load Considerations
LoadRunner	At least one of	Controller has heavy load.
Enterprise Hosts:	each.	Load generator has medium load.
Controller,		Data processor has medium to high load.
Generator, and Data Processor		It is recommended to designate spare Controllers and load generators for fault- tolerance and high availability purposes.
		Note:
		<ul> <li>You can configure a host as a Controller + Load Generator, but this is not recommended because running Vusers consumes a lot of resources. Running Vusers on the Controller host is only appropriate for performance tests that have a small number of Vusers.</li> <li>You can configure a host as a Controller + Data Processor, but this is not recommended because data processing might consume high amounts of CPU and resources.</li> </ul>
MI Listener	At least one, if	Medium load.
	you are monitoring over a firewall.	<ul><li>Standalone installation is required.</li><li>Cannot exist on a machine running IIS.</li></ul>
Monitor Over	At least one, if	Light load.
Firewall machine	you are monitoring over a firewall.	Standalone installation is required.
SiteScope (optional)	One	Light load.

**Tip:** Consider the communication paths between different components when installing LoadRunner Enterprise, and their resource demands. This information helps you configure your system to evenly distribute the load, and prevent overloading any resource. For details, see "Communication paths" on page 14.

### Distributed Denial of Service attack protection

Consider implementing DDoS attack protection on servers hosting LoadRunner Enterprise Web client only in cases where your LoadRunner Enterprise Web client is exposed to the public Internet. In most production environments, deploying LoadRunner Enterprise Web client on the public Internet are rare, therefore carefully consider if this best practice applies to your specific deployment.

A few DDoS attacks such as Slowloris may be mitigated by implementing third party protections such as the following:

- Setting request limits.
- Setting header limits.
- Restricting IP addresses.

For details, see the Microsoft documentation.

In addition, you can also apply restrictions, such as setting timeouts and header limits, in the **PCWEB\Web.config** and **PCWEB\PCX\Web.config** files.

**Note:** Due to the nature of these attacks, it is not possible to implement application-specific fixes or enhancements to prevent these types of attacks.

### **Clustered configuration**

LoadRunner Enterprise can be run on a single node cluster. A cluster is a group of application servers that run as if they were a single system. Each application server in a cluster is referred to as a node.

Clusters provide mission-critical services to ensure maximum scalability. The load balancing technique within the cluster is used to distribute client requests across multiple application servers, making it easy to scale to an infinite number of users.

Take the following into consideration when setting up a clustered environment:

• All nodes must have access to the database server on which you configure the system.

- All nodes must have access to the repository. For example, if the repository is located on the first node in the cluster, all other nodes must have access to the first node. If you install the repository on a dedicated machine, each node must have access to that machine.
- The load balancer must be configured with session persistency. Set the persistency to **sticky session enabled** or **destination address affinity**, depending on the load balancer.

The following diagram illustrates a clustered LoadRunner Enterprise system configuration:

### Prerequisites for clustering

You can install LoadRunner Enterprise on a single node or as a cluster. This section describes the prerequisites for installing LoadRunner Enterprise as a cluster on a Windows environment.

- Check with your system administrator whether you are installing LoadRunner Enterprise on a single node or as a cluster.
- If you are installing LoadRunner Enterprise on cluster nodes, verify which machine to use as the first node to start the installation and the number of machines you should use. This depends on the number of users and availability considerations.
- When creating a common repository for the cluster nodes, the folder must be shared with the domain user used for configuring the cluster nodes.
- The LoadRunner Enterprise account should be set with a domain user that has the correct permissions for setting a cluster environment; the IUSR\_METRO user does not have permissions on a remote repository or on the IIS web server of the first node and on hosts.
- Configure each node with the same Site Administration and Lab database schema names (not just the same database server).

This is important because when a node is installed in cluster mode, the Lab schema name is not read from the common repository. For example, if node A is installed with schema names **LRE\_ADMIN\_MYSCHEMA** and **LRE\_LAB\_ MYSCHEMA**, when node B is installed, the schema names is automatically populated in the Configuration wizard with **LRE\_ADMIN\_MYSCHEMA** and **LRE\_ DEFAULT\_LAB\_DB**.

Therefore, you need to manually change the Lab database schema name from **LRE\_DEFAULT\_LAB\_DB** to **LRE\_LAB\_MYSCHEMA**.

• You must use the same communication passphrase on all nodes.

For details on installing LoadRunner Enterprise as a cluster, contact OpenText support.

### System component considerations

The LoadRunner Enterprise system includes several components. This section provides pre-installation considerations for each of the components. For system requirement details for each component, see the Support Matrix (System Requirements).

LoadRunner Enterprise Server	<ul> <li>Uninstall any 12.6x or earlier installations of the LoadRunner Enterprise server (formerly Performance Center server) from your machine. Also make sure that Network Virtualization was uninstalled, or uninstall it manually.</li> </ul>
	<ul> <li>You can install LoadRunner Enterprise 24.1 or 24.3 as a full installation, or over an existing LoadRunner Enterprise 2020.x installation. If installing as a full installation, we recommend installing the LoadRunner Enterprise server on a clean machine with a new image.</li> </ul>
	<ul> <li>To install a LoadRunner Enterprise server, you must have full local administrative rights on the designated machine.</li> </ul>
	• The LoadRunner Enterprise server requires a specific Windows user to be defined on the machine. When using the default user or a custom local user, the user is created on the machine and is added to the Administrator group. Ensure that there is no security system in place that prevents creating the user or that removes the user from the Administrators group. For details on how to create this user, see "Install and configure LRE servers and hosts" on page 48.
	<ul> <li>Microsoft Windows Script Host must be version 5.6 or later. To verify the version number, go to the <windows_ installdir&gt;\Windows\system32 directory. Right-click wscript.exe and select Properties. In the Version tab, verify the file version number.</windows_ </li> </ul>
	IIS:
	<ul> <li>Before installing the LoadRunner Enterprise server, you must install Microsoft Internet Information Services (IIS 10).</li> </ul>
	<b>Note:</b> For better security, we recommend following the Microsoft IIS security best practices to harden your IIS web server.
	• You must allow LoadRunner Enterprise file extensions in IIS. To do this, open IIS Manager. Under the IIS section for the LoadRunner Enterprise server application, open <b>Request</b> <b>Filtering</b> , click <b>Edit Feature Settings</b> , and clear <b>Allow</b> <b>unlisted file name extensions</b> so that only file extensions that are explicitly defined are used. Add the following to the list of allowed file extensions: : .html, .js, .css, .map, .aspx, .ascx, .ash, .asmx, .eot, .otf, .ttf, .woff, .woff2, .json, .svg, .svc, .xml, .png, .jpg, .jpeg, .gif, .axd, .ico, and . (to include paths with no extension).
	<ul> <li>During installation, some IIS features are updated on all LoadRunner Enterprise servers using IIS. For example, Active</li> </ul>

	Server Pages, ASP.NET 4.6 (IIS 10), ASP.NET 4.7 (IIS 10), Metabase, Static content, IIS 6.0 Management Compatibility, and Dynamic Compression are <b>enabled</b> , while URL Authorization is <b>disabled</b> .
	Oracle:
	<ul> <li>Ensure that the Oracle client installed on the LoadRunner Enterprise server is at least the same version as on the Oracle server, and that connectivity is established with the Oracle server.</li> </ul>
	<ul> <li>Only a 64-bit Oracle client installation is required.</li> </ul>
	<ul> <li>If you install the Oracle client after installing the LoadRunner Enterprise server, you must restart the machine after installing the Oracle client.</li> </ul>
	<ul> <li>Oracle Monitoring: When defining Oracle monitors, install the LoadRunner Enterprise server in a directory whose path does not include any of the following characters: ():;*\/"~&amp;?{} \$%   &lt;&gt; + = ^[]. For example, on a 64-bit machine, do not install the LoadRunner Enterprise server in the default installation directory (C:\Program Files (x86)\), as this path includes illegal characters.</li> </ul>
LoadRunner Enterprise Host	<ul> <li>To install a LoadRunner Enterprise host, you must have full local administrative rights on the designated machine.</li> <li>The LoadRunner Enterprise host requires a specific Windows user to be defined on the machine. This user is configured when adding the host to LoadRunner Enterprise Administration. When using a default user or a custom local user, the user is created on the machine and added to the Administrator group. Ensure that there is no security system in place that prevents creating the user or removes the user from the Administrators group. For details on how to create this user, see "Install and configure LRE servers and hosts" on page 48.</li> <li>LoadRunner Enterprise supports the InfluxDB time series database for storing data externally. The InfluxDB time series host installation.</li> </ul>
Standalone Load Generator (Windows)	You cannot install the standalone load generator on the same machine as the LoadRunner Enterprise server or LoadRunner Enterprise host.

Standalone Load Generator (Linux)	You can install the standalone load generator on Linux to run Vusers. The Linux Vusers interact with the Controller that is installed on a Windows machine. For details, see "Install a load generator on Linux" on page 92.
MI Listener	<ul><li>The MI Listener must be installed on a standalone machine.</li><li>The MI Listener cannot be installed on a machine running IIS.</li></ul>
Monitor Over Firewall Machine	The Monitor Over Firewall agent must be installed on a standalone machine.
SiteScope Server	<ul> <li>SiteScope is used for monitoring applications.</li> <li>Refer to the <i>SiteScope Deployment Guide</i> for minimum requirements.</li> </ul>

### Windows system locale considerations

The Windows system locale (Culture and UI Culture) of the user running the LoadRunner Enterprise environment (IUSR\_METRO unless changed) must match the localized version of your LoadRunner Enterprise software.

When working with a non-localized version of LoadRunner Enterprise, the locale must be set to English (EN-xx). Since the LoadRunner Enterprise user is created and configured when the machine is added to the LAB project, the system locale needs to be verified after completing all of the configuration steps.

#### To set the system locale for the LoadRunner Enterprise server:

- 1. Open **Control Pane > Clock and Region**, and in the **Formats** tab set the format to the desired language.
- 2. In the **Administrative** tab, click the **Change system locale** button, set **Current system locale** to the desired language, and then restart the machine.
- 3. After the machine restarts, in **Language** settings, set the selected language as the default language, and then restart the machine.

#### To set the system locale for the LoadRunner Enterprise host:

1. Open **Control Pane > Clock and Region**, and in the **Administrative** tab click the **Copy settings** button.

- 2. Select the check box for **Welcome screen and system accounts**, and then click **OK**.
- 3. Restart the machine.

## **Required services**

Before you install LoadRunner Enterprise components, check that the services defined in the table below are running on each component machine and that the startup type for each service is defined as **Automatic**.

**Note:** The default settings for running the services on the operating system may differ from one version to another. Check all of the services on each machine to ensure that the required services are running.

Machine	Services
All LoadRunner Enterprise servers and hosts	<ul> <li>IPsec Policy Agent (for TCP/IP security)</li> <li>Remote Procedure Call (RPC)</li> <li>Windows Management Instrumentation (for LoadRunner Enterprise health check)</li> <li>Windows Event Log (optional, used for debugging)</li> <li>COM+ services (Event System and System application)</li> <li>System Event Notification (for COM+)</li> </ul>
LoadRunner Enterprise servers	<ul> <li>IIS Admin Service (Microsoft Service)</li> <li>Workstation</li> <li>TCP/IP NetBIOS Helper</li> <li>World Wide Web Publishing Service (Microsoft Service)</li> <li>Distributed Transaction Coordinator (MSDTC)</li> </ul>
LoadRunner Enterprise hosts	<ul> <li>Remote Registry Service (requires for host monitor)</li> </ul>

## Pre-installation prerequisites and considerations

This section includes pre-installation prerequisites and considerations for all LoadRunner Enterprise components.

Prerequisite software	For the list of prerequisites software that must be installed on your machine before you can install LoadRunner Enterprise, see the Support Matrix (System Requirements) in the LoadRunner Enterprise Help Center.
Permission requirements	To install and configure a LoadRunner Enterprise server or LoadRunner Enterprise host, you must have full local administrative rights on the designated machine.
	UAC and DEP do not need to be deactivated to install or run LoadRunner Enterprise components.
Planning the environment	<ul> <li>Separate machines. LoadRunner Enterprise servers and hosts must be installed on separate machines.</li> <li>LoadRunner installations. LoadRunner Enterprise components must be installed on different machines to LoadRunner Professional installations.</li> <li>Load considerations. Decide which machine is to be used for what purpose. Consider the expected load on each machine where where</li></ul>
	For details, see "Load considerations" on page 18.
	<ul> <li>Dedicated host machines. We recommend:</li> </ul>
	<ul> <li>Installing LoadRunner Enterprise hosts on dedicated machines that do not contain, or provide access to sensitive information.</li> </ul>
	<ul> <li>Making a thorough security review of the network topology and access levels in your testing environment.</li> </ul>

Network considerations	<ul> <li>Map network drive. If the LoadRunner Enterprise installation directory is located on a network drive, we recommend mapping the network drive before running the installation. For details, see "Unable to run the setup LRE server or host installation from a network drive" on page 182.</li> <li>Add to Trusted Sites. To enable running the installation from a network location, make sure that the network location path is added to the Trusted Sites of the installation machine.</li> </ul>
Remote Desktop connection	If you are installing a LoadRunner Enterprise server or LoadRunner Enterprise host using a Remote Desktop connection (RDP), you must connect using the Console session.
VMWare	LoadRunner Enterprise is certified to work with VMWare ESX/ESXi 5.0 and higher. Due to the rapidly evolving architectures provided by Virtualization vendors, as long as the third party vendor guarantees full compatibility of the virtualized environment with the LoadRunner Enterprise approved system requirements for physical hardware, then LoadRunner Enterprise works as designed.
Standalone applications	To install standalone applications, you must manually install the prerequisite software. For the list of required prerequisites, see the Support Matrix (System Requirements) in the LoadRunner Enterprise Help Center. For details on installing the prerequisites in silent mode, see "Silent installation" on page 78.
Language settings	Ensure that the operating system and the database are both configured for the same language to avoid texts being corrupted in LoadRunner Enterprise. For example, if you are working with German, ensure that you are working on a German operating system, and that the database is configured for German.

### Database prerequisites

This section provides an overview of the prerequisites for connecting LoadRunner Enterprise to an Oracle, Microsoft SQL, and PostgreSQL database server.

Note:

- Make sure that you create the LoadRunner Enterprise database user before you start the LoadRunner Enterprise installation process.
  - LoadRunner Enterprise is not supported with cloud managed databases (RDS).
  - Oracle, Microsoft SQL, and PostgreSQL database servers can be set with an IPv4 or IPv6 address. When using IPv6 address, you must use an IPv6 host name and not an FQDN

### Oracle Database servers

This section includes:

- "Oracle Database Admin user requirements" below
- "Oracle client requirements" on the next page
- "Oracle Database considerations: Specify an Oracle user profile" on page 31
- "Oracle Database considerations: Add additional Oracle grants" on page 33

### **Oracle Database Admin user requirements**

- To connect LoadRunner Enterprise to an Oracle database server, the installing database user must have sufficient permissions to perform specific administrative tasks in Oracle. These tasks include creating the project user schema and copying data between projects.
- If you are unable to use the Oracle system user due to security reasons, we
  recommend that your database administrator create a LoadRunner Enterprise
  database administrative user, for example Ire\_admin\_db, with the specific
  permissions required to install LoadRunner Enterprise.

Your database administrator can create a LoadRunner Enterprise database administrative user using a script, see this KB article. This script creates the LoadRunner Enterprise database administrative user with the recommended grants required on the database.

If you are using a container database (CDB), all scripts for creating the LoadRunner Enterprise database user must be run while directly connected to the CDB. Those scripts must be run by a user with SYSDBA system permissions. **Note:** When using CDB, the script invokes the "CONTAINER=Current" parameter.

#### Oracle client requirements

- The Oracle clients must be installed on the LoadRunner Enterprise server with **Administrator** installation type, and connectivity must be successfully established with the Oracle server.
- The **tnsnames.ora** file must contain the net service configuration that has the information to access the Oracle database server.
- Only a 64-bit Oracle client installation is required.

To install the Oracle clients:

- a. Create a root folder for the Oracle clients (c:\oracle in the example).
- b. Install the Oracle client 64-bit version within a new dedicated folder (client\_ 64 in the example) under the root folder.
- c. Copy the relevant **tnsnames.ora** and **sqlnet.ora** files into the Oracle clients root folder.

- d. Set the **TNS\_ADMIN** environment variable for the Oracle clients root folder (see the example above).
- e. Restart the machine.
- f. Install LoadRunner Enterprise. See "Install and configure LRE servers and hosts" on page 48.

### Oracle Database considerations: Specify an Oracle user profile

Since every project created in LoadRunner Enterprise is a user in Oracle, and each user created needs to be connected to a profile, you can specify a profile for your project to use in the configuration. This profile is added to the user when the Oracle user is created.

- 1. On the LoadRunner Enterprise server, stop the LoadRunner Backend Service.
- 2. Copy the following:

```
"SiteParameters": {
    "OracleDbUserProfileForNewProject": {
    "Value": "",
    "Description": "Add the db profile that will be used when creating a new oracle
user, value is a string",
    "IsSystem": true,
    "IsVisible": false
    }
}
```

- 3. Depending on the type of environment you are using:
  - For a clustered environment: To affect all cluster nodes, paste the copied section to the remote appsettings.json file under the repository (for example, pc-repo\SqlEnvironment\system\_config\).
  - For a single node: To affect this node only, paste the copied section to appsettings.json in the <LRE\_server\_installdir>\LRE\_BACKEND\ folder.

**Note:** Do not make any changes to the default configuration file, **appsettings.defaults.json**.

4. Add the user profile you want to use to the

#### OracleDBUserProfileForNewProject value.

Make sure that you define the user profile in the same way that it is defined in the database; with or without quotes. When defined with quotes in the database, you must use the escape character (\) in the configuration file.

```
Example: Profile created without quotes
```

```
"SiteParameters": {
    "OracleDbUserProfileForNewProject": {
    "Value": "myprofile",
    "Description": "",
    "IsSystem": true,
    "IsVisible": false
    }
}
```

#### Example: Profile created with quotes (use escape character)

```
"SiteParameters": {
    "OracleDbUserProfileForNewProject": {
    "Value": "\"myprofile\"",
    "Description": "",
    "IsSystem": true,
    "IsVisible": false
    }
}
```

5. Make sure the JSON file is valid and save your changes.

### Oracle Database considerations: Add additional Oracle grants

You can customize the LoadRunner Enterprise configuration file by adding additional Oracle grants to a user if the default grants are not sufficient.

- 1. On the LoadRunner Enterprise server, stop the LoadRunner Backend Service.
- 2. Copy the following:

```
"SiteParameters": {
    "OracleDbUserExtraGrants": {
    "Value": "",
    "Description": "Add extra grants to each user created by the app, separate each
grant with ';' omit the word 'GRANT' and 'to', will added by the app.",
    "IsSystem": true,
    "IsVisible": false
    }
}
```

- 3. Depending on the type of environment you are using:
  - For a clustered environment: To affect all cluster nodes, paste the copied section to the remote appsettings.json file under the repository (for example, pc-repo\SqlEnvironment\system\_config\).
  - For a single node: To affect this node only, paste the copied section to appsettings.json in the <LRE\_server\_installdir>\LRE\_BACKEND\ folder.

**Note:** Do not make any changes to the default configuration file, **appsettings.defaults.json**.

 Add any specific grants that you want to give to a user to the OracleDBUserExtraGrants value.

Separate each grant with a semi-colon (;) and omit the words "GRANT" and "to" because they are added automatically.

```
Example:

"SiteParameters": {

    "OracleDbUserExtraGrants": {

    "Value": "EXECUTE ON SYS.DBMS.LOB",

    "Description": "",

    "IsSystem": true,

    "IsVisible": false

    }

}
```

5. Make sure the JSON file is valid and save your changes.

### Microsoft SQL Database servers

Below is a list of prerequisites that are required when using a Microsoft SQL

Database server:

DB connection permissions	To connect LoadRunner Enterprise to a Microsoft SQL database server, the installing database user must have sufficient permissions to perform specific administrative tasks in SQL.
	<ul> <li>For SQL Authentication: An admin database user with "dbcreator" level permissions and a user with "public" permissions.</li> </ul>
	• For Windows Authentication: A domain user with "dbcreator" permissions. LoadRunner Enterprise must be configured with this service user.
Collation	Collation for the SQL server must be set to <b>SQL_Latin1_General_ CP1_CI_AS</b> .

Connection parameters	To add additional connection string parameters to a SQL server:
	<ol> <li>Go to <lre_server_installdir>\LRE_BACKEND and open the appsettings.defaults.json file.</lre_server_installdir></li> </ol>
	<ol> <li>Modify the connection string in the "SiteParameters:MssqlExtraGlobalConnectionStringParam s" section as required.</li> </ol>
	3. Save the changes.
	<ol> <li>Restart the LoadRunner Backend Service, and try the database connection again from the Configuration wizard.</li> </ol>
	<b>Note:</b> If the certificate installed on the SQL Server is self-signed (which is usually not recommended provided a proper certificate is installed), you need to add "TrustServerCertificate=true" to "Value". After the change, this section should look like:
	"MssqlExtraGlobalConnectionStringParams": { "Value": "Command Timeout=300;TrustServerCertificate=true", "Description": "Add extra connection parameters for Mssql if needed", "IsSystem": true, "IsVisible": false },

### PostgreSQL Database servers

To connect LoadRunner Enterprise to a PostgreSQL database server, the installing database user must either be:

- A PostgreSQL superuser with "CreateDatabase" and "CreateRole" permissions, or
- A PostgreSQL **non-superuser** with the following permissions: Rolcanlogin = true, Rolcreatedb = true, Rolcreaterole = true, and Rolconnlimit = -1.

### Notes and limitations

- Migrating projects from 12.6x versions of LoadRunner Enterprise on Oracle or Microsoft SQL to LoadRunner Enterprise 202x on PostgreSQL is not supported.
- If you try to install two environments (such as staging and production or a multitenant environment) on the same PostgreSQL database server, they overrun each other.

**Resolution:** Set up a separate PostgreSQL database server for each environment.

- a. The first environment can be configured by running the LoadRunner Enterprise Configuration wizard. For details, see "Configure LRE servers and hosts" on page 53.
- b. For the second environment, you must change the LRE tenant name.
  - i. Open the **appsettings.defaults.json** file located in the **<LRE\_server\_ installdir>\LRE\_BACKEND** folder.
  - ii. In the 'Site' section, change the **"LRETenantName"** value to one that is to different to the values on all the other environments.

```
"Site": {
    "SchemaName": "lre_site_management_db",
    "LREAdminSchemaName": "lre_siteadmin_db",
    "LRELabSchemaName": "lre_default_lab_db",
    "LRETenantName": "LRE",
    "LRETenantGuid": "fa128c06-5436-413d-9cfa-9f04bb738df3"
},
```

 The first time you install LoadRunner Enterprise, and for every time zone change you make on the LoadRunner Enterprise server or database, make sure that you align the time zone from the operating system with the time zone in **postgresql.conf** on the database server machine. Failure to do this results in the Active Reservation/Timeslot ID column being empty in the Hosts grid when you run a test.

#### To align the time zone:

a. On the database server machine, open pgAdmin. Open **lre\_<tenant-name>\_ tenant\_db** or any LoadRunner Enterprise related DB file.

Open a new script and run:

```
SELECT now()
```

Check if there are any differences between the time displayed in the query result and the time of the operating system.

b. Check the time zone set in PostgreSQL by running:
SHOW timezone

Check the time zone on the operating system to verify that a different time zone is set. If the time zones are the same then you have a different issue and there is no need to continue with these steps.

c. Go to <postgresql-install-dir>/<version-of-pg>/data and open the postgresql.conf file. Search for the "timezone" section. You should find the following line:

timezone = '<Continent>/<City>'

d. Go back to pgAdmin and run the following:

SELECT name, abbrev, utc\_offset, is\_dst FROM pg\_timezone\_names ORDER BY utc\_ offset;

This should give you a table of all available values that you could put in the **postgresql.conf** file. Select the name that matches the operating system time zone. Replace the value in **postgresql.conf** with the chosen value, and save the file.

e. In pgAdmin run:

```
SELECT pg_reload_conf();
```

Followed by:

SHOW timezone

Followed by:

SELECT now()

It should now display the correct (OS) time zone and time.

f. Run a test and check for **Active Reservation/Timeslot ID** in the Hosts grid. The problem should be resolved.

# Installation package details

You can find information and components for the installation as follows:

Support Matrix	Provides information on supported operating systems, technologies, and integrations. For details, see Support Matrix (System Requirements).
<b>Standalone</b> <b>installations</b> (for example, for the load generator)	Found in the installation package's <b>Standalone</b> <b>Applications</b> folder. For details, see "Install standalone components" on page 89.
Additional components (such as the Citrix Agent)	Found in the installation package's <b>Additional</b> <b>Components</b> folder. For details, see "Install additional components" on page 102.

# Pre-installation project migration steps

# Project migration pre-installation activities

If you are migrating performance tests from Performance Center, this chapter presents migration considerations to be taken into account before installing LoadRunner Enterprise.

This chapter includes:

- "Pre-installation project migration considerations" below
- "Upgrade existing Performance Center/ALM projects to LoadRunner Enterprise" on the next page
- "Back up projects in ALM installation" on page 42
- "Overview of migration process" on page 43

# Pre-installation project migration considerations

Review and perform the following before migrating existing projects to LoadRunner Enterprise.

 To work with Performance Center/ALM projects in LoadRunner Enterprise, you first need to upgrade your projects to Performance Center 12.6x (ALM 12.60) before you can migrate them to LoadRunner Enterprise 2023. For details, see "Upgrade existing Performance Center/ALM projects to LoadRunner Enterprise" on the next page.

**Note:** Direct ALM migration is not supported. Instead, you must migrate ALM projects to LoadRunner Enterprise 2023, and then upgrade to the latest LoadRunner Enterprise version.

- In addition, review the Support Matrix (System Requirements) in the LoadRunner Enterprise Help Center to make sure that you meet the requirements for working with the LoadRunner Enterprise version being used.
- Review the list of features that are not available or fully implemented in this release. For details, see Unsupported features in the LoadRunner Enterprise Help

Center.

• Before beginning the installation, back up the projects, the database, and the repository. For details, see "Back up projects in ALM installation" on the next page.

**Note:** During the migration process, data is taken from ALM in read-only mode; therefore, no changes should occur on the database level.

• Migrating projects from one database type in ALM 12.60 to another database type in LoadRunner Enterprise is not supported.

# Upgrade existing Performance Center/ALM projects to LoadRunner Enterprise

The following table describes how to upgrade and migrate projects from Performance Center/ALM to LoadRunner Enterprise. Note that not all projects can be migrated directly to LoadRunner Enterprise.

Performance Center	To LoadRunner Enterprise
Performance Center 12.6x	Projects in ALM 12.60 can be migrated directly to LoadRunner Enterprise 2020-2023, provided the LoadRunner Enterprise system user has access to the location where the Performance Center/ALM 12.6x repository (source for migration) is stored.
	Direct ALM migration to LoadRunner Enterprise 2023 R1 or later is not supported. Instead, you must migrate to LoadRunner Enterprise 2023, and then upgrade to the latest LoadRunner Enterprise version.
	For migration details, see the Migrate projects section in the LoadRunner Enterprise Help Center.

Performance Center	To LoadRunner Enterprise
Performance Center 11.52 - 12.5x	The Performance Center/ALM repository must be moved to the location of the ALM 12.6x repository.
	Projects must first be upgraded to ALM 12.60, after which they can be migrated to LoadRunner Enterprise. For details, see the Upgrade projects section in the ALM Help Center.
	<b>Note:</b> You must first upgrade <b>LAB_PROJECT</b> , and then any Performance Center template projects, before migrating Performance Center projects.
Performance Center 11.00	Projects must first be upgraded to ALM 11.52, and then to ALM 12.60, after which they can be migrated to LoadRunner Enterprise. For details, see the ALM 11.52 Installation and Upgrade Guide.
	<b>Note:</b> You must first upgrade <b>LAB_PROJECT</b> , and then any Performance Center template projects, before upgrading Performance Center projects.

### Back up projects in ALM installation

Back up all your projects in the existing ALM installation that you plan to migrate. We recommend that you deactivate projects before backing them up.

If you must back up while your project is still active, you must back up the database before the file system. We also recommend backing up the file system as soon as possible after backing up the database.

#### Note:

- Before you run the migration process, perform a full backup of your projects that includes the project database schema and the project repository.
- **Version Control:** Version control enabled projects cannot be backed up while there are checked out entities. All entities must be checked in to the corresponding version of Quality Center or ALM. To determine if there are checked out entities, see this KB article.

#### To back up the project database schema on the database server:

- **Microsoft SQL database.** To back up the project database schema on the database server, see this KB article.
- **Oracle database.** To back up the project database schema on the database server, see this KB article.

## **Overview of migration process**

Migrating projects from Performance Center to LoadRunner Enterprise requires the following steps:

- Upgrading Performance Center projects to ALM 12.60 (pre-installation)
   For details on upgrading Performance Center projects to ALM 12.60, see the Upgrading projects section in the ALM Help Center.
- Migrating the Site Admin and LAB schemas from ALM (during installation) During the installation process, you need to migrate the configuration data that was stored in ALM Site Admin and LAB to LoadRunner Enterprise.

For details, see "Install and configure LRE servers and hosts" on page 48

**Note:** You can also perform this step post-installation from the Configuration wizard, provided you specify a new Site Admin and LAB schema for LoadRunner Enterprise (if you use the existing schemas nothing happens). For details, see the post-installation steps in the LoadRunner Enterprise Help Center.

3. Migrating the project data (post-installation)

After installing LoadRunner Enterprise, you need to migrate project data and the file repository from existing projects to LoadRunner Enterprise using the migration tool in LoadRunner Enterprise Administration.

Project data which includes scripts, attachments, run results, .xml files, and templates is migrated from ALM Site Admin and LAB to the LoadRunner Enterprise server.

# Installation and configuration

# Install LoadRunner Enterprise

This chapter describes how to install LoadRunner Enterprise versions 24.1 and 24.3. They are full installations and the installation process is the same for both. You can install either version as a clean installation, or over an existing LoadRunner Enterprise 2020 or later installation.

#### This chapter includes:

Installation flow	
Upgrade LoadRunner Enterprise	
Install and configure LRE servers and hosts	
Secure communication and the system user	64
Silent installation	
Deploy LoadRunner Enterprise on AWS	
Install standalone components (Windows)	
Install a load generator on Linux	
Deploy Dockerized load generators on Linux	
Deploy Dockerized load generators on Windows	
Install additional components	
Uninstall LoadRunner Enterprise server and hosts	
Uninstall the load generator from Linux	

## Installation flow

This section describes the steps required to install LoadRunner Enterprise.

#### Installation Guide

Installation and configuration

Install standalone applications that provide advanced features for working with LoadRunner Enterprise. For details, see "Install standalone components (Windows)" on page 87.

To install a load generator on Linux, see "Install a load generator on Linux" on page 92.

To install the load generator through a Docker container, see "Deploy Dockerized load generators on Linux" on page 92 / "Deploy Dockerized load generators on Windows" on page 97.

Perform additional tuning and configuration settings to get the most out of LoadRunner Enterprise. For details, see "Configuration options" on page 109.

You can set LoadRunner Enterprise to run Vusers and monitor servers over a firewall. For details, see "Working with firewalls" on page 146.

Perform a post-installation verification. For details, see "Post-installation verification" on page 106.

For installation troubleshooting details, see "Installation issues" on page 182.

After the installation is successful, you can migrate existing projects from Performance Center 12.6x (ALM 12.60) to LoadRunner Enterprise 2023, and then upgrade to the latest LoadRunner Enterprise version. For details, see Migrating the project data in "Overview of migration process" on page 43.

# Upgrade LoadRunner Enterprise

LoadRunner Enterprise versions 24.1 and 24.3 are full installations that can be installed over any LoadRunner Enterprise 2020 or later installation.

To upgrade all components in your installation, follow the installation process as described in "Install and configure LRE servers and hosts" below. The installation process detects the older version, and gives you the option to upgrade.

**Note:** For silent upgrade, see "Installing an upgrade in silent mode" on page 86.

#### Before upgrading to a later version

- We recommend creating a back up of your Site Admin and Lab DB schemas before you start to safeguard against any unexpected changes during the upgrade process. For details, see Back up projects in the LoadRunner Enterprise Help Center.
- If you are upgrading to a new version of LoadRunner Enterprise and you have more than one LoadRunner Enterprise server installed, you must perform the following on all LoadRunner Enterprise servers:
  - a. Stop IIS, the LoadRunner Backend Service, and the LoadRunner Alerts Service.
  - b. Install the latest version of LoadRunner Enterprise. For details, see "Install and configure LRE servers and hosts" below.

### Install and configure LRE servers and hosts

This section describes how to install and configure LoadRunner Enterprise servers and hosts.

- "Install LRE servers and hosts" on the next page
- "Configure LRE servers and hosts" on page 53

#### Note:

- Review the LoadRunner Enterprise installation flow before running the installation. For details, see "Installation flow" on page 46.
- If you are upgrading from an earlier version of LoadRunner Enterprise, review the upgrade instructions in "Upgrade LoadRunner Enterprise" on the previous page.
- If you are migrating 12.6x or earlier projects from Performance Center, follow the instructions in "Project migration pre-installation activities" on page 40.

### Install LRE servers and hosts

1. Launch the LoadRunner Enterprise installer.

Download the installer package, and run **setup.exe**.

If an earlier version of the product is installed on your machine, the installation process detects the older version, and gives you the option to upgrade or exit the installation.

2. Select an installation option.

The setup program starts and displays the installation menu page.

Select LoadRunner Enterprise or LoadRunner Enterprise Host.

**Note:** If a host machine is to be used as a load generator only, we recommend that you install the Standalone Load Generator because the installation requires less disk space, and it is less time-consuming to move the load generator's setup files (compared to the LoadRunner Enterprise Host). For details on installing the Standalone Load Generator, see "Install standalone components (Windows)" on page 87. To install a load generator on Linux, see "Install a load generator on Linux" on page 92.

3. If necessary, install prerequisite software.

Specific software needs to be installed on the machine before you can install the LoadRunner Enterprise component. For details, see the Support Matrix (System Requirements) in the LoadRunner Enterprise Help Center. If the prerequisite software is not already installed on your computer, a dialog box opens displaying the list of prerequisite programs that are required.

Click **OK** and follow the on-screen instructions to install the prerequisite software. You cannot continue with the LoadRunner Enterprise component installation unless all the prerequisite software is installed.

#### Note:

- In general, we strongly recommend performing a restart of your machine before performing a host installation.
- If prompted to restart the machine after installing the prerequisite software, you MUST restart before continuing with the installation. After the restart, run **setup.exe** again to continue with the installation. If the installation continues from where it left off before restarting, we recommend starting **setup.exe** again. This enables the installer to detect the installed prerequisites and continue with the installation.
- If Microsoft Internet Information Services (IIS) 10 is listed on this page when installing a LoadRunner Enterprise server, close the installation, install IIS, and restart the installation.
- 4. Start the installation.
  - For LoadRunner Enterprise Server: The LoadRunner Enterprise Setup Wizard opens, displaying the Welcome page. Click **Next**.
  - For LoadRunner Enterprise Host: The LoadRunner Setup Wizard opens, displaying the Welcome page. Select LoadRunner Enterprise Host, and click Next.
- 5. Review the License agreement.

To accept the terms of the license agreement, select **I accept the terms in the License Agreement**.

For LoadRunner Enterprise Host only:

 If you plan to run JMeter, Gatling, or Silk Performer scripts in LoadRunner Enterprise, make sure to select the Install JMeter after installation, Install Gatling after installation, or Install Silk Performer Agent after installation options during setup as required.  To help us improve the quality, reliability, and performance of LoadRunner Enterprise, select **Participate in LoadRunner improvement program**. This enables us to collect anonymous information about your software and hardware configuration, and about how you use LoadRunner Enterprise. Click **More Details** in the user interface for more information.

**Caution:** Participating in the improvement program can create additional overhead on the host machine.

#### Click Next.

6. Select a destination folder.

Specify the location in which to install the LoadRunner Enterprise component. By default, LoadRunner Enterprise is installed to C:\Program Files (x86)\OpenText\LoadRunner Enterprise\.

To choose a different location, enter the location or click the **Change** button, select a location, and click **OK**.

#### Note:

- When upgrading from LoadRunner Enterprise 2020 SP2 or SP3, the location field is read-only.
- (LoadRunner Enterprise Host only). To reduce problems due to the Microsoft Windows API path limitation, choose a short name for your installation directory path. For example: "C:\LREHost".

#### Click Next.

7. Start the installation process.

The wizard prompts you to confirm the details and start the installation. To review or change any settings, click **Back**.

Click **Install** to start the installation. The wizard displays the installation progress.

8. On completion of the installation, the **Finish** page opens in which you can view the installation log files and install Network Virtualization (NV). The LoadRunner Enterprise installation is complete, regardless of the selected NV installation option.

- Click the Open Installation Log link to view the installation log files. The files are also available on the LRE server or host in the configurationWizardLog\_pcs.txt file in the <installdir>\orchidtmp\Configuration folder. Log files for the NV installation, if installed, are available in C:\Temp\NV\_Logs.
- To install NV, choose one of the below options, or click **Do not install** to skip NV installation. You can install NV manually at a later time.
  - **Typical.** Automatically launches a non-interactive NV installation, using the default NV settings.
  - Custom. Automatically launches an interactive NV installation, enabling you to set the installation folder, data folder, and port to be used, and select which NV components to install.

#### Note:

- If you install NV on a LoadRunner Enterprise server, the NV for LoadRunner Enterprise installation is launched. If you install NV on a LoadRunner Enterprise host, both the NV for Controller and the NV for Load Generator installations are launched (one after the other).
- If you install NV automatically, deactivate Windows SmartScreen before proceeding with the installation. To do this, open HKEY\_ LOCAL\_

MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Expl orer in the Registry Editor, and change the Value data for SmartScreenEnabled to "Off". You do not need to deactivate SmartScreen when installing NV manually.

- If you upgrade host machines from Performance Center 12.6x to LoadRunner Enterprise 2023.x or later, and NV for Controller and NV for Load Generator co-exist on the same machine, you cannot modify setup configuration settings for a Custom mode installation.
   Resolution:
  - A. Exit the wizard and uninstall the NV components.
  - B. Reinstall the NV components by manually running the NV installation. See the installation section in the Network Virtualization for LoadRunner Help.
- 9. Click **Next** to continue with the configuration.

### Configure LRE servers and hosts

1. Prerequisites.

If you plan configuring the LoadRunner Enterprise server and IIS to work with a secure (SSL) connection, we recommend making sure that a server certificate has been imported and a corresponding HTTPS binding is created for the site before running the Configuration Wizard.

- **Note:** For increased security, we recommend changing the default IIS landing page so that it redirect users to a different realm, such as the secure portal.
- a. Go to the IIS root folder (usually C:\inetpub\wwwroot), and make a copy of the **iisstart.htm** file.
- b. Open **iisstart.htm**, running notepad as administrator, and locate the following section:

```
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />
```

- 2. Start the LoadRunner Enterprise configuration.

After completing the LoadRunner Enterprise installation, click **Next**. The Welcome page of the Configuration wizard opens.

Click **Next** to start the configuration process.

3. Create the LoadRunner Enterprise service user (LoadRunner Enterprise server only).

LoadRunner Enterprise requires that a system user is created for use by the LoadRunner Enterprise server, hosts and the Load Generator standalone machines.

- a. In the LRE Service User page, specify a user to run the service.
  - If you select Use Default Credentials, LoadRunner Enterprise is configured with the LoadRunner Enterprise system user, IUSR\_METRO, and adds it to the machine's Administrators group.
  - To define your own system user for the LoadRunner Enterprise environment, clear the Use Default Credentials check box, and enter the domain, user, and password. Enter credentials using one of the following formats: domain\username or username@domain.

#### Note:

- You can use a local or a domain user. When using a local user, if the user does not exist on the LoadRunner Enterprise server machine, the installer creates it.
- When using a local user, if the user name does not exist or is not in the Administrators group, it is added to the Administrators group.
- When using a domain user, make sure that the domain user is a member of the Administrators group.
- You must have a domain user set in the Configuration wizard when setting the repository path to a network location.
- The LRE Service user you set here must have permissions for the file repository (see Configure the repository).
- After adding the LoadRunner Enterprise server to the project, the LoadRunner Enterprise user is saved to that database. Each subsequent LoadRunner Enterprise server or host that is added, is configured with that user.
- After adding a LoadRunner Enterprise server, you can use the System Identity utility to change the user. For details, see the System Identity Utility Window in the LoadRunner Enterprise Help Center.
- After creating the system user and configuring the server, the LRE Service User page is not displayed the next time you launch the Configuration wizard.

#### b. Click Next.

4. Configure the repository.

a. In the **Repository** page, click the **Browse** button, or enter the path of the new LoadRunner Enterprise repository.

#### Note:

- Make sure that you select a path where you have full read and write permissions.
- The user account that was set in the LRE Service User page must have permissions for the file repository (see Create the LRE Service User).
- The file repository is supported with Azure Files Share using a UNC path (not a mapped drive).
- To work with cluster nodes, make sure that all nodes have access to the file repository path, and that the path is UNC. All nodes in the cluster must have the same string for the repository path.
- The maximum length of the file repository path is 200 characters.
- The file repository path cannot reside on the root folder, and it cannot be on a mapped drive.
- b. Click **Test Connection** to check whether you can connect to the repository using the user credentials you provided.
- c. Click Next.
- 5. Configure the connection to the LoadRunner Enterprise database server.
  - a. In the **DB Connection** page, select the database type to be used in your LoadRunner Enterprise system: Oracle, Microsoft SQL, or PostgreSQL (supported for on-premises versions only).
  - b. If you select a Microsoft SQL Server, choose the authentication type:
    - **MS-SQL (SQL Auth).** Microsoft SQL authentication authenticates the user to the database using a database user name and password.
    - MS-SQL (Windows Auth). Microsoft SQL Windows authentication relies on the user being authenticated by the operating system.
  - c. Configure the database administrator and user credentials:

Database	MS-SQL:
Administrator Credentials	<ul> <li>SQL Authentication: Enter the name and password of an admin database user with "dbcreator" level permissions required to install LoadRunner Enterprise on the database server.</li> <li>Windows Authentication: Read-only field which displays the name and password of the domain user used for the LoadRunner Enterprise installation.</li> <li>Note: Windows Authentication mode is only supported if LoadRunner Enterprise is configured with a domain user. If it is configured with a local</li> </ul>
	is available.
	Oracle:
	<ul> <li>Enter the name and password of the user with the administrative permissions required to install LoadRunner Enterprise on the database server.</li> </ul>
	PostgreSQL:
	<ul> <li>Enter the name and password of a PostgreSQL superuser with "Create Database" and "CreateRole" permissions, or a PostgreSQL non-superuser with the following permissions: Rolcanlogin = true, Rolcreatedb = true, Rolcreaterole = true, and Rolconnlimit = -1 on the database server.</li> </ul>
Database User	SQL Authentication:
Credentials	<ul> <li>Enter the name and password of a user with "public" level permissions to be used by LoadRunner Enterprise to connect to the database after the installation is complete.</li> <li>Oracle:</li> </ul>
	<ul> <li>Set the default password for the new database users.</li> </ul>

**Note:** You can change the database administrator and user credentials at any time from the Database Password Changer utility. For details, see "Change the database administrator and user passwords" on page 137.

d. In the **Connection Details** section, select one of the following options:

 Connection string parameters. Select this option to enter database server information using the following fields:

Server Host	<ul> <li>MS-SQL: Enter the database server name. For example, dbsrv01.</li> <li>Oracle: This field is read-only.</li> <li>PostgreSQL: The PostgreSQL server address.</li> <li>Note: Oracle, Microsoft SQL, and PostgreSQL database servers can be set with an IPv4 or IPv6 address. When using IPv6 address, you must use an IPv6 host name and not an FQDN</li> </ul>
Port	<ul> <li>MS-SQL: Enter the database server port number, or accept the default port number.</li> <li>Oracle: This field is read-only.</li> <li>PostgreSQL: Enter the port on which the PostgreSQL server is listening, or leave empty to use the default port (5432).</li> </ul>
Net Service Name (Oracle only)	Enter the net service name found in the local <b>tnsnames.ora</b> file. <b>Note:</b> The Oracle net service name must be in the same case as it appears in the <b>tnsnames.ora</b> file.

 Connection string. Select this option to manually edit the database server connection string, and provide the net service name from the local tnsnames.ora file.

**Note:** The database name cannot be longer than 128 characters for a Microsoft SQL database, or 253 characters for an Oracle or PostgreSQL database.

- e. Click **Test Connection** to check whether you can connect to the database server using the user credentials you provided.
- f. Click Next.
- 6. Configure the database schema.
  - a. In the **DB Schema Configuration** page, enter a schema name for the Site Management database, the Site Admin database, and the LAB database.

**Note:** The Site Management schema is created regardless of whether you are using a single or multi-tenant system.

- b. If you are creating a PostgreSQL project, enter the password to be used when creating the new logins which are part of the database creation process.
- c. If you are creating an Oracle project, enter the following:

Tablespace	Select or enter the path to a storage location that has sufficient space to store the new project. You should not use <b>UNDO</b> as the storage location.
Temporary Tablespace	Select or enter the path to a temporary storage location that has sufficient space to store the new project.

- d. Click Next.
- 7. Configure security settings.
  - a. In the Security Settings page, enter a confidential data passphrase that LoadRunner Enterprise uses to encrypt the information. The passphrase is case-sensitive, and must contain at least 12 alphanumeric characters. Ensure there are no empty spaces before or after the passphrase.

We recommend making a note of the passphrase for future usage.

#### Note:

- After completing the server configuration wizard, you cannot change the confidential data encryption passphrase.
- If you are installing LoadRunner Enterprise on a cluster, you must use the same passphrase for all nodes.
- Passwords for accessing external systems (databases and LDAP) are stored by LoadRunner Enterprise after encryption.
- b. Enter a secure communication passphrase that LoadRunner Enterprise uses to encrypt the SSO token. Communication between LoadRunner Enterprise and other OpenText applications is enabled after authentication by a Single Sign-On (SSO) token.

The passphrase must contain at least 12 alphanumeric characters only.

- c. Click Next.
- 8. Configure the LoadRunner Enterprise server and IIS for SSL.

When configuring a LoadRunner Enterprise server, you can choose whether to work with a non-secure (HTTP) or a secure (SSL) connection. When you use the SSL option during server installation, a self-signed SSL certificate is automatically generated on the local LoadRunner Enterprise machine and the IIS server. Alternatively, you can import a certificate from a certified authority (CA).

**Note:** When using the LoadRunner Enterprise server with a secure connection, make sure that you have configured IIS to use SSL on the LoadRunner Enterprise server machine. You can also configure LoadRunner Enterprise to work with SSL post-installation. For details, see "Configure LRE servers and hosts to work with TLS/SSL" on page 110.

a. In the SSL Configuration page, select Configure SSL for LoadRunner Enterprise to use a secure connection.

If you are using a non-secure (HTTP) connection, clear this option and click **Next** to proceed to the next step.

- b. From the **Certificate store** list, select the name of the provider that stores the certificate.
- c. Select the server-side certificate file that is to be used on the listening port during an SSL handshake. You can import a certificate, or use an existing certificate.

Import a certificate	<ul> <li>To import a certificate from a certified authority, select the <b>Import certificate</b> check box, and choose a certificate file (it must be in .pfx format).</li> </ul>
	ii. Enter the password used to access the certificate file.
	iii. Enter the host name and port of the LoadRunner Enterprise server used by the agent.

Use	To use an existing certificate, clear the <b>Import</b>	
existing	<b>certificate</b> check box, and select a certificate from the	
certificate	<b>Existing certificates</b> list.	
	<ol> <li>Enter the host name and port of the LoadRunner Enterprise server used by the agent.</li> </ol>	

d. Click Next.

#### 9. Define the site administrator.

**Note:** This step is not relevant (and the **LRE Administration User** page is not displayed) if you are using a database that was already created. For example, when performing an upgrade.

Enter a user name and password for a site administrator. These credentials are used to create a user to log in to both LoadRunner Enterprise Administration and the Site Management console for the first time. These are two separate users, and updating one does not have any effect on the other.

After installation, you can change the site administrator or add other site administrators.

a. In the **LRE Administration User** page, enter a site administrator user name and password, and retype the password to confirm.

#### Note:

- The user name cannot include the following characters: \ / : \* ? " < > |
- The password cannot be longer than 20 characters.
- Keep a record of these credentials because you need them to initially access LoadRunner Enterprise Administration, the Site Management console, and the System Identity Changer utility.
- b. Select a secret question for resetting the password and enter an answer.
- c. Click Next.
- 10. Configure the mail server.

A mail server enables LoadRunner Enterprise users to send emails to other users in a project.

- a. In the **Mail Server Configuration** page, select **Configure Mail Server** if you plan to use a mail server. Otherwise, click **Next** and proceed to the next step.
- b. Select which server to use and complete the SMTP account settings:

The user's email address.
The SMTP server available on your local area network.
The port number used by the outgoing mail server. By default, port 25.
Choose whether to make your connection more secure. The following options are available: SSL and Start TLS. <b>Note:</b> SSL/TLS is currently not supported.
If your SMTP server requires authentication, select this option to provide credentials for authentication. Enter the user name and password.
Opens the Test Mail dialog box. Enter an email address and click <b>Send</b> . A message box confirms whether the mail was sent successfully.

- c. Click Next.
- 11. Check the configuration summary.

The **Summary** page opens, and displays the configuration settings you selected. Review and confirm the details.

To change any settings, click **Edit** in the relevant section to open the corresponding page in the wizard, and make the necessary changes.

Click **Start Configuration** to start the configuration.

**Note:** Make sure the Windows Services Manager is closed when running the configuration.

12. The background configuration starts.

After the DB schema has been created or upgraded, the **Configuring Process** page opens, and displays the progress bar as it performs the configurations on the relevant component.

LoadRunner LoadRunner Configuration **Enterprise Host Enterprise Server** Copies and updates configuration files. Yes Yes Creates the LoadRunner Enterprise system user. Yes No. The user is created when For details on changing the system user, see adding a host to Change the LoadRunner Enterprise system user in LoadRunner the LoadRunner Enterprise Help Center. Enterprise Administration. Configures DCOM objects. No. DCOM objects No. DCOM objects are configured are configured when adding a when adding a host server to to LoadRunner LoadRunner Enterprise Administration. Enterprise Administration. Installs LoadRunner Enterprise services: \*Yes, except for the \*\*Yes, except for LoadRunner Data the LoadRunner LoadRunner Data Collection Agent\* Alerts Service and Collection Agent LoadRunner Remote Management Agent Service LoadRunner • LoadRunner Alerts Service (available in Backend Service. LoadRunner Enterprise\*\* LoadRunner Backend Service\*\* For details on how to reconfigure the port used by the LoadRunner Data Collection Agent service, see Software Self-solve knowledge base article KM01526547. Yes Installs LoadRunner Enterprise services: LoadRunner Agent Service LoadRunner Data Service LoadRunner Load Testing Service

The wizard performs the following configurations on the relevant component:

Configuration	LoadRunner Enterprise Server	LoadRunner Enterprise Host
Configures IIS:	Yes	
Creates virtual directories and application pools.		
• Configures IIS application pools to work as 32-bit application pools.		
• Sets the .NET version for the application pools to .NET 4 (v4.0.30319).		
Sets Integrated mode for the application pools.		
• Sets read and write permissions for the Modules feature.		
Updates Mime type list.		
Updates IIS Feature Delegation.		
For IIS 10:		
<ul> <li>Adds rules: IIS-ASP, IIS-ASPNET, IIS-ASPNET45, IIS-ManagementConsole, IIS-Metabase, IIS-IIS6ManagementCompatibility, IIS- StaticConten, IIS-HttpCompressionDynamic.</li> </ul>		
Deactivates rules: IIS-URLAuthorization		
If the configuration is stuck in the "Updating IIS installation" stage (at about 40% progress) for more than 15 minutes, there might be a lock conflict if Windows Update is running in parallel. We recommend canceling and restarting the configuration.		

13. On completion of schema creation, the **Finish** page opens.

To view the configuration log files click the **Open Configuration Log** link. The files are also available on the LoadRunner Enterprise server or host in the **configurationWizardLog\_pcs.txt** file in the **<installdir>\orchidtmp\Configuration** folder.

#### Note:

 To prevent Denial-of-Service (DoS) attacks on LoadRunner Enterprise servers, we recommend configuring Dynamic IP Restrictions for IIS. For details, see Using Dynamic IP Restrictions in the Microsoft IIS documentation.

- After completing the configuration process, if the site is accessed from a public network, we recommend configuring IIS for accessing HTTPS protocols only. For details, see "Configure IIS to work with TLS/SSL" on page 112.
  - If you are using the TLS 1.2 protocol, we recommend deactivating the 3DES and RC4 ciphers on Windows servers by removing them from the HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\ Cryptography\Configuration\Local\SSL\00010002 registry. You can check the list of the ciphers on a machine by running the Get-TlsCipherSuite command in PowerShell.

Click **Finish** to exit the Configuration wizard.

- 14. After installing and configuring LoadRunner Enterprise, you need to restart the virtual machine on which the LoadRunner Enterprise server is installed.
- 15. Perform the additional post-installation configuration steps. For details, see "Post-installation configuration steps" on page 133.

### Secure communication and the system user

This topic provides information on LoadRunner Enterprise communication security and the LoadRunner Enterprise system user.

### Overview

When installing LoadRunner Enterprise servers and hosts, a Communication Security passphrase is defined which enables secure communication between the components. You can update the Communication Security passphrase on the LoadRunner Enterprise system components. For details, see "Update the Communication Security passphrase" on the next page.

LoadRunner Enterprise also creates a default system user for use by the LoadRunner Enterprise server and hosts, the Site Management console, and the Load Generator standalone machines. You can change the system user using the System Identity Changer Utility. For details, see "Change the system user" on the next page.

### Update the Communication Security passphrase

This task describes how to update the Communication Security passphrase on the LoadRunner Enterprise system components. The Communication Security passphrase must be identical on all of the components of the system.

 From the LoadRunner Enterprise server installation's \bin directory, open the System Identity Changer Utility (C:\Program Files (x86)\OpenText\LoadRunner Enterprise\IdentityChangerBin).

**Note:** You can run this utility from any one of the LoadRunner Enterprise servers in the system.

2. The System Identity Changer Utility opens. For user interface details, see "System Identity Changer Utility" on page 68.

In the **Communication Security Passphrase** section, select **Change**, and enter the new Communication Security passphrase.

3. Click Apply.

After the Communication Security passphrase has been successfully updated on the LoadRunner Enterprise components, you must reset IIS and restart the LoadRunner Backend Service and the LoadRunner Alerts Service on the LoadRunner Enterprise servers.

### Change the system user

During installation of the server and hosts, a default LoadRunner Enterprise system user, **IUSR\_METRO** (default password **P3rfoRm@1nceCen1er**), is created in the Administrators user group of the server/host machines.

The LoadRunner Enterprise server is installed with the System Identity Changer Utility that enables you to manage the LoadRunner Enterprise system user on the LoadRunner Enterprise server and hosts from one centralized location. Use this utility to update the LoadRunner Enterprise system user name and password. When you change the system user, or a user's password, the System Identity Changer Utility updates the LoadRunner Enterprise components.

#### Note:

- To prevent security breaches, you can replace LoadRunner Enterprise's default system user by creating a different local system user, or by using a domain user.
- You can use a REST command to silently change the system user password in the System Identity Changer utility without having to use the user interface. For details, see "Update the system user password" on page 139.

#### To change the system user:

1. Prerequisites

- When changing the system user, LoadRunner Enterprise must be down. That is, all users must be logged off the system and no tests may be running.
- When changing the user password:
  - ° Ensure that each host is listed in the Machines table under **one alias only**.
  - In the case of a domain user, when the domain IT team notifies you that the password is to be changed, you need to temporarily change the LoadRunner Enterprise system user on the LoadRunner Enterprise server and hosts to a different user. After the domain IT team has changed the password of the domain user and has notified you of this change, you need to change the LoadRunner Enterprise system user back to the domain user on the LoadRunner Enterprise server and hosts.

**Note:** This utility does not apply changes to UNIX machines, Standalone load generators, or machines that are located over the firewall.

2. Launch the System Identity Changer Utility on the LoadRunner Enterprise server

In the LoadRunner Enterprise server installation's **\bin** directory, open the System Identity Changer Utility (**C:\Program Files** 

#### (x86)\OpenText\LoadRunner Enterprise\IdentityChangerBin).

The System Identity Changer Utility opens. For user interface details, see "System Identity Changer Utility" on the next page.

- 3. Change the details of the LoadRunner Enterprise user
  - a. Enter the relevant details to update and click **Apply**.
  - b. The **Machines** table displays the status of each machine during the configuration process.
  - c. The utility performs steps in the following order:
    - i. LoadRunner Enterprise hosts are reconfigured first. Any failures at this phase won't stop the process from continuing.
    - ii. If you are using a cluster environment with multiple LoadRunner Enterprise servers, all LoadRunner Enterprise servers except for the one from which the utility is running are reconfigured. Any failures at this phase won't stop the process from continuing.
    - iii. The LoadRunner Enterprise server from which the utility is running is reconfigured. Failure at this level is critical, and prevents the process from continuing.
    - iv. The configuration shared by all LoadRunner Enterprise environments is updated. This step is dependent on the previous step succeeding.
  - d. The utility attempts to configure all the hosts, even if the configuration on one or more hosts is unsuccessful. In this case, after the utility has attempted to configure all the hosts, correct the errors on the failed hosts and click **Reconfigure**. The utility runs again on the whole system.
    For details on troubleshooting System Identity Changer Utility issues, see "Troubleshoot System Identity Changer and system user issues" on page 74.
- 4. Verify that the system user was changed on the LoadRunner Enterprise server
  - a. Open IIS Manager. Under **Sites > Default Web Site**, choose a virtual directory.

- b. Under Authentication select Anonymous Authentication. Verify that the anonymous user defined was changed for the following virtual directories:
   PCS, LoadTest and Files (a virtual directory in LoadTest).
- c. Check in the **PCQCWSAppPool** and **LoadTestAppPool** application pools that the identity is the LoadRunner Enterprise user.

### System Identity Changer Utility

This utility enables you to update the LoadRunner Enterprise Communication Security passphrase, as well as the LoadRunner Enterprise system user and/or password on the LoadRunner Enterprise server, hosts, and Site Management console from one centralized location.

You can open the System Identity Changer Utility from C:\Program Files (x86)\OpenText\LoadRunner Enterprise\IdentityChangerBin.

#### Note:

- When using the System Identity Changer Utility, always authenticate with internal authentication using the initial admin user and password provided during LoadRunner Enterprise configuration, no matter which authentication type is in use.
- For a single tenant environment: Only a Site Admin user can log into the System Identity Changer Utility.
- For a multi-tenant environment: Only a Site Management user can log into the System Identity Changer Utility. For details, see Multi-tenancy in the LoadRunner Enterprise Help Center.

<b>UI Elements</b>	Description
Apply	Applies the selected changes on the LoadRunner Enterprise server and hosts, starting with the LoadRunner Enterprise server.
Reconfigure	If, when applying a change, there are errors on any of the LoadRunner Enterprise hosts, troubleshoot the problematic host machines, then click <b>Reconfigure</b> . The utility runs again on the LoadRunner Enterprise server and hosts.

<b>UI Elements</b>	Description
LoadRunner Enterprise User	The LoadRunner Enterprise system user details.
	• Change. Enables you to select which detail to change.
	<ul> <li>None. Do not change the user's name or password.</li> </ul>
	<ul> <li>Password Only. Enables you to change only the LoadRunner Enterprise system user's password.</li> </ul>
	Note: See "Prerequisites" on page 66.
	<ul> <li>User. Enables you to change the LoadRunner Enterprise system user name and password.</li> </ul>
	<ul> <li>Domain\Username. The domain and user name of the LoadRunner Enterprise system user.</li> </ul>
	<ul> <li>Password/Confirm Password. The password of the LoadRunner Enterprise system user.</li> </ul>
	• Delete Old User. If you are changing the user, this option enables you to delete the previous user from the machine.
	<b>Note:</b> You cannot delete a domain user.

<b>UI Elements</b>	Description
User Group	The details of the user group to which the LoadRunner Enterprise system user belongs.
	Group type. The type of user group.
	<ul> <li>Administrator Group. Creates a user in the Administrators group with full administrator policies and permissions.</li> </ul>
	<ul> <li>Other. Creates a local group under the Users group, granting policies and permissions as well as other LoadRunner Enterprise permissions.</li> </ul>
	Note: To configure LoadRunner Enterprise with a configuration user and a restricted user, you must specify a <b>Group type.</b> If the group type is not the <b>Administrator</b> <b>Group</b> , you must set the group with full permission over the LoadRunner Enterprise repository prior to applying the change from the System Identity Changer Utility. To do this:
	<ol> <li>On the LoadRunner Enterprise server(s), go to the LoadRunner Enterprise repository.</li> </ol>
	2. Right-click the folder, and select <b>Properties</b> .
	<ol><li>Select the Security tab.</li></ol>
	4. Edit the "Group or user names" section.
	<ol><li>Add the group you intend to use in the System Identity Change Utility.</li></ol>
	<ol><li>Allow this group to have Full control and apply the change.</li></ol>

<b>UI Elements</b>	Description
Configuration User	If you are creating a non-administrative LoadRunner Enterprise system user, that is, if you selected <b>Other</b> under <b>User Group</b> , you need to configure a configuration user (a system user with administrative permissions) that the non- administrative LoadRunner Enterprise system user can impersonate when it needs to perform administrative tasks. For details, refer to "Change the system user" on page 65.
	If you selected <b>Delete Old User</b> in the <b>LoadRunner</b> <b>Enterprise User</b> area, ensure that the configuration user you are configuring is not the same as the system user you are deleting. Alternatively, do not delete the old user.
	<ul> <li>Domain\Username. The domain and user name of a system user that has administrator permissions on the LoadRunner Enterprise server and hosts.</li> </ul>
	• <b>Password/Confirm Password.</b> The password of a system user that has administrator permissions on the LoadRunner Enterprise server and hosts.
Communication Security Passphrase	The Communication Security passphrase that enables the LoadRunner Enterprise servers and hosts to communicate securely.
	• <b>Change.</b> Enables you to change the passphrase.
	• <b>New passphrase.</b> The new Communication Security passphrase.
	<b>Note:</b> This passphrase must be identical on all LoadRunner Enterprise components. For details, refer to the "Update the Communication Security passphrase" on page 65.

Installation and configuration

<b>UI Elements</b>	Description
Machines grid	The machine configuration settings:
	<ul> <li>Type. Indicates whether the machine type is a LoadRunner Enterprise server or a host.</li> </ul>
	Name. The machine name.
	<ul> <li>Configuration Status. Displays the configuration status on each of the LoadRunner Enterprise components.</li> </ul>
	<ul> <li>Configuration complete. The system user configuration was completed.</li> </ul>
	<ul> <li>Needs to be configured. The LoadRunner Enterprise server/host is pending configuration. Displayed only after the LoadRunner Enterprise server configuration is complete.</li> </ul>
	<ul> <li>Configuring The LoadRunner Enterprise server/host is being configured.</li> </ul>
	<ul> <li>Configuration failed. The LoadRunner Enterprise server/host configuration failed. The utility displays the reason for failure together with this status.</li> </ul>
	<b>Note:</b> See "Change the details of the LoadRunner Enterprise user" on page 67.

### Configure a non-administrator system user

For stronger security, you can configure the LoadRunner Enterprise system to use a non-administrator user and a custom group (lockdown mode).

This system user has the same permissions granted to any user in the built-in 'Users' group with additional extended rights to Web services and the file system and registry as described below:

- Granted all the permissions described in "Required policies for the system user" on the next page.
- Added to the built-in system groups **Performance Log Users** and **IIS\_IUSRS** (on LoadRunner Enterprise server only).
- The custom group is added to the built-in system groups **Distributed COM Users** and **Users**.
Installation Guide Installation and configuration

With the above-mentioned permissions, a system user cannot perform all of the administrative system tasks. Therefore, when configuring the system to use non-administrator user, you need to specify a configuration user (a user with administrative permissions that is defined on the LoadRunner Enterprise server and hosts).

This configuration user is used by LoadRunner Enterprise when administrative tasks are required by system. For example, tasks for changing a system user, resetting IIS, restarting services, accessing IIS metadata, configuring DCOM.

After completing such tasks, the system user reverts back to the previous user with the limited LoadRunner Enterprise user permissions.

**Note:** The configuration user is saved in the database, so that whenever an administrative-level system user is required to perform a task, the system automatically uses the configuration user, without prompting for the user's credentials.

## Required policies for the system user

This section describes the required policies LoadRunner Enterprise grants automatically to a system user.

**Note:** This section applies to:

- An administrative or non-administrative LoadRunner Enterprise user.
- All LoadRunner Enterprise servers and hosts.

The LoadRunner Enterprise user must be granted all of the following policies:

Policy Name	Reason
Create global object ( <b>SeCreateGlobalPrivilege</b> )	For Autolab running Vusers on the Controller.
Batch logon rights ( <b>SeBatchLogonRight</b> )	The minimum policies required to run Web applications.
Service logon rights ( <b>SeServiceLogonRight</b> )	The minimum policies required to run Web applications.

Policy Name	Reason
Access this computer from the network ( <b>SeNetworkLogonRight</b> )	The minimum policies required to run Web applications.
Log on locally ( <b>SeInteractiveLogonRight</b> )	Required by infra services. For example, after restart, the system logs in with the LoadRunner Enterprise system user.
Impersonate a client after authentication ( <b>SeImpersonatePrivilege</b> )	Required for running LoadRunner Enterprise processes under the LoadRunner Enterprise system user.

# Troubleshoot System Identity Changer and system user issues

This section provides information for troubleshooting issues related to the System Identity Changer utility and the LoadRunner Enterprise system user.

### Error running the System Identity Changer utility

### **Problem Description**

When running **IdentityChangerUtil.exe**, you receive the following error: "Another instance is already running. Please switch to it."

This is because there is another instance of the System Identity Changer utility already running.

### Troubleshooting

- If you can see the other instance, use that one, or close it and then restart the utility.
- If you cannot see the other instance of the utility, it means that another user is running it on the same machine. Switch to the other user and close the utility before attempting to run it with a different username.

Unable to connect to the LoadRunner Enterprise Server

### **Problem Description**

When entering the LoadRunner Enterprise site administrator credentials on the LoadRunner Enterprise server, the "Unable to connect to the LoadRunner Enterprise Server" error occurs.

This error can be caused by a number of issues, including connectivity problems, security settings, or because the LoadRunner Enterprise server services are not up and running.

### Troubleshooting

Verify that the LoadRunner Enterprise Backend Service is up and running.

### Error changing the system user

The following are possible error messages you could encounter when trying to change the system user.

Error Message	Description	Troubleshooting
Can't apply changes. Not all hosts are in idle state.	You receive this error because one or more of the hosts is currently busy with another operation.	<ol> <li>Log in to LoadRunner Enterprise Administration and go to the Hosts module. Verify that all hosts are in the Idle state.</li> </ol>
		2. If all of the hosts are in the <b>Idle</b> state, make sure that any other hosts that belong to the host pool are not idle.
		3. Open the System Identity Changer utility again. For details, see "System Identity Changer Utility" on page 68.
Make sure that you have entered a different username.	You receive this error because you are trying to change the user to the current username.	Choose a different username.

Error Message	Description	Troubleshooting
Configuration failed: Failed to find the Load Testing Service on <machine name="">. Please verify that the service exists and that it is running.</machine>	This error might appear because the LoadRunner Load Testing Service isn't running, or because the SSO key is defined on the host.	<ul> <li>Select Start &gt; Run and enter services.msc. In the Services window, verify that the LoadRunner Load Testing Service is running.</li> <li>Check that the SSO key which is defined on the host matches the SSO key defined on the LoadRunner Enterprise Server. You can check the SSO key in the following locations:</li> <li>On the LoadRunner Enterprise Server: <lre_ server_ installdir&gt;\dat\PCS.config</lre_ </li> <li>On the host: <lre_host_ installdir&gt;\dat\LTS.config</lre_host_ </li> <li>If the keys do not match, change the key in LTS.config</li> <li>file on the host. Then open the Services window and restart the LoadRunner Load Testing Service.</li> </ul>

Error Message	Description	Troubleshooting
One of the following error messages appears:	You probably receive this error because the configuration user you	Supply a configuration user which has administrator permissions on all the machines on which you are
<ul> <li>Problem adding required policies</li> </ul>	provided does not have the required	trying to change the user.
<ul> <li>Problem adding user to group</li> </ul>	perform the requested operation.	
<ul> <li>Problem changing application pool identity</li> </ul>		
<ul> <li>Problem changing COM settings</li> </ul>		
<ul> <li>Problem changing IIS</li> </ul>		
<ul> <li>Problem changing password</li> </ul>		
<ul> <li>Problem changing PC Group</li> </ul>		
<ul> <li>Problem creating group</li> </ul>		
<ul> <li>Problem creating user</li> </ul>		
<ul> <li>Problem deleting old identity</li> </ul>		
Problem removing     user from Admin		

Unable to reconfigure LoadRunner Enterprise hosts or servers

### **Problem Description**

Unable to reconfigure hosts or the LoadRunner Enterprise Server from LoadRunner Enterprise Administration.

This occurs when the System Identity Changer utility failed to configure the LoadRunner Enterprise Server or hosts, and you have since closed the utility.

### Troubleshooting

Installation Guide Installation and configuration

Perform the change System User task again from the beginning. For details, see "Change the system user" on page 65.

### Denied access to the internal Influx database server

### **Problem Description**

If you uninstall a host and reinstall it again, and during this time the LoadRunner Enterprise system user name or password is changed, access to the internal Influx database on the host is denied.

This is because Influx stores its data in a folder that also includes the data of the previous authentication user. By default, the folder is under **<LRE\_host\_** installdir>\orchidtmp\influxdb.

### Troubleshooting

You need to delete this folder in order for LoadRunner Enterprise to reconfigure the database with the new user.

## Silent installation

A **silent installation** is an installation that is performed automatically, without the need for user interaction. This section describes how to perform a silent installation of LoadRunner Enterprise components.

Before you perform the installation, review the pre-installation information, including the system requirements, described in "Before you install" on page 9.

This section includes:

- "Prerequisite software for silent installation" below
- "Customize silent installation" on page 80
- "Silent installation on LRE server and hosts" on page 82

## Prerequisite software for silent installation

Install the prerequisite software silently by running the relevant commands as follows:

Prerequisite Software	Command
.NET Framework 4.8	<pre>\Setup\Common\dotnet48\ndp48-x86-x64- allos-enu.exe /LCID /q /norestart /c:"install /q"</pre>
	<b>Note:</b> .NET Framework 4.8 replaces the .NET Framework 4.6.2 and earlier files. If there are any applications that are using the .NET Framework 4.6.2 or earlier files and are running during the installation of .NET Framework 4.8, you may need to restart your machine. If you are prompted to restart the machine, restart it before continuing the installation. For details, see the .NET documentation.
.Net core hosting 6.0.15	<pre><installdir>\Setup\Common\dotnet_hosting\dotnet- hosting-6.0.15-win.exe /quiet OPT_NO_RUNTIME=1 OPT_ NO_SHAREDFX=1 OPT_NO_X86=1</installdir></pre>
Microsoft Access Database Engine 2016	<pre>\Setup\Common\AccessDatabaseEngine_ x64\accessdatabaseengine_X64.exe /quiet /norestart</pre>
Microsoft Visual	For 2015-2019 (LRE 2022 R1 or earlier):
C++ Redistributable for Visual Studio 2015-2019 / 2015-2022	<pre>\Setup\Common\vc2015_redist_x86\vc_ redist.x86.exe /quiet /norestart</pre>
	For 2015-2022 (LRE 2022 R2 or later on LRE hosts only):
	<pre>\Setup\Common\vc2022_redist_x86\vc_ redist.x86.exe /quiet /norestart</pre>
Microsoft Visual	For 2015-2019 (LRE 2022 R1 or earlier):
C++ Redistributable for Visual Studio	<pre>\Setup\Common\vc2015_redist_x64\vc_ redist.x64.exe /quiet /norestart</pre>
2015-2019 /	For 2015-2022 (LRE 2022 R2 or later on LRE hosts only):
2015-2022 (x64)	<pre>\Setup\Common\vc2022_redist_x64\vc_ redist.x64.exe /quiet /norestart</pre>
Internet Information	See the Microsoft documentation for the PowerShell command required for your IIS version.
Services (IIS)	Note: LoadRunner Enterprise server only.

## Customize silent installation

This section describes how to customize the file used for silent configuration of the LoadRunner Enterprise. The **UserInput.xml** file installed with LoadRunner Enterprise, contains parameters for the LoadRunner Enterprise server and LoadRunner Enterprise host configurations.

You can customize the parameters in the **UserInput.xml** file. You then instruct the Installer to use the customized file for the silent configuration input.

### To configure the properties in the UserInput.xml file:

- Copy the UserInput.xml file from the LoadRunner Enterprise installation directory (...\Setup\Install\[Host][Server]\) to another location.
- Open the copy of the file and enter a user-defined value for the LW\_CRYPTO\_ INIT\_STRING property.

**Note:** This passphrase must be identical to the passphrase defined during the installation.

3. Configure the following properties on the LoadRunner Enterprise Server:

Property	Description
IIS_WEB_SITE_ NAME	Choose the IIS web site used to host the LoadRunner Enterprise server services. <b>Note:</b>
	<ul> <li>The web site must exists prior to running the configuration.</li> </ul>
	• The value is optional. If no web site is specified and there is more than one defined on your machine, the configuration uses the first one (the one with the smallest ID value).
SystemUserName	Choose the name of the user configured as the LoadRunner Enterprise Windows system user.
	<b>Note:</b> You can use a local or a domain user:
	• If you are using a local user, the user is added to the Administrator group.
	<ul> <li>If you are using a domain user, the value for this property should be in the form of <domain\user>.</domain\user></li> <li>Make sure the machine and the user are part of the same domain and that the user exists on the machine.</li> </ul>
	<ul> <li>If you do not provide a user name, the system uses the default user name ('IUSR_METRO').</li> </ul>
	<ul> <li>A user name cannot include the following characters []:   &lt; + &gt; = ; , ? * @</li> </ul>
	• If the supplied user's details are invalid (for example, the user name contains invalid characters, or the domain user does not exist), the system uses the default user name ('IUSR_METRO') instead.
	For details on defining a user, see "Install and configure LRE servers and hosts" on page 48.

Installation and configuration

Property	Description
SystemUserPwd	Choose the password for the LoadRunner Enterprise Windows system user.
	Note:
	<ul> <li>If the installer uses the default user (for example, when the value for property 'SystemUserName' is empty), the password property is ignored and the installer uses the default password ('P3rfoRm@1nceCen1er').</li> </ul>
	<ul> <li>A password cannot include the following characters</li> <li>&lt; &gt;   &amp; " ^ or space.</li> </ul>
	<ul> <li>A password cannot be empty. If this field is empty, the system uses the default password ('P3rfoRm@1nceCen1er').</li> </ul>
	<ul> <li>If using an existing user for the 'SystemUserName' property, the password must match the password used by the existing user.</li> </ul>

4. Configure the following properties on the LoadRunner Enterprise host:

Property	Description
LRASPCHOST=1	Add this property to install LoadRunner as a LoadRunner Enterprise Host.
IMPROVEMENTPROGRAM=0	The option to participate in the VuGen improvement program is enabled by default. Add this property if you want to deactivate it. For details, see VuGen improvement program.

- 5. Save the UserInput.xml file.
- 6. Specify the location of the saved file when running the silent installation command.

## Silent installation on LRE server and hosts

This section describes how to run the silent installation of the LoadRunner Enterprise server and LoadRunner Enterprise hosts on a Windows platform.

The silent installation is followed by the silent configuration which calls the **UserInput.xml** file for configuration parameters. You can customize the

parameters in this file for the LoadRunner Enterprise server configuration. For details, see "Customize silent installation" on page 80.

You can perform a silent installation of LoadRunner Enterprise using one of the following options:

- "Option 1: Install the prerequisite software and the LoadRunner Enterprise component" below
- "Option 2: Install the prerequisite software together with the LoadRunner Enterprise components" on page 85

**Note:** If you are installing Network Virtualization (NV), you must deactivate Windows SmartScreen before proceeding with the silent installation. To do this, open HKEY\_LOCAL\_ MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer in the Registry Editor, and change the Value data for "SmartScreenEnabled" to "Off".

### Option 1: Install the prerequisite software and the LoadRunner Enterprise component

1. Install the prerequisite software. For details, see "Prerequisite software for silent installation" on page 78.

**Note:** If you are prompted to restart the computer after installing the prerequisite software, you must do this before continuing with the installation.

2. After you have installed all the prerequisite software, install the LoadRunner Enterprise component by running the appropriate command from the command line.

```
Server installation with default properties
```

```
msiexec /i <LRE_installdir>\Setup\Install\Server\LRE_Server.msi
INSTALLDIR="<Target Installation Directory>" NVINSTALL=Y /qnb /l*vx "<Path to log
file>"
```

Server installation with customized UserInput.xml

msiexec /i <LRE\_installdir>\Setup\Install\Server\LRE\_Server.msi

```
USER_CONFIG_FILE_PATH="<Full path to UserInput file>" INSTALLDIR="<Target
Installation Directory>" NVINSTALL=Y /qnb /l*vx "<Path to log file>"
```

#### Host installation:

```
msiexec /i <LRE_installdir>\Setup\Install\Host\LoadRunner_x64.msi
```

```
USER_CONFIG_FILE_PATH="<Full path to UserInput file>" [optional installer properties
- see list below] /qn /l*vx "<Path to log file>"
```

In the above examples:

<full path="" to<br="">UserInput file&gt;</full>	Is the path to your customized UserInput.xml file.
<target installdir&gt;</target 	Is the directory in which to install the LoadRunner Enterprise server or host.
<path log<br="" to="">file&gt;</path>	Is the full path to installation log file.
NVINSTALL	Indicates whether to launch the NV installation in silent mode, once the LoadRunner Enterprise installation is done. By default, NV is not installed in silent mode.
Note: Restarting the machine is required in order for NV to function properly.	

# Option 2: Install the prerequisite software together with the LoadRunner Enterprise components

You can also install in silent mode using the **setup.exe** file from the LoadRunner Enterprise installation directory. This enables you to install the prerequisites in silent mode automatically before running the MSI installation in silent mode. Using this option also invokes the correct MSI file depending on the operating system platform.

```
Server installation:
```

```
<LRE_installdir>\Setup\En\setup_server.exe /s
USER_CONFIG_FILE_PATH="<Full path to UserInput file>"
INSTALLDIR="<Target Installation Directory>" NVINSTALL=Y
```

#### Host installation:

```
<LRE_installdir>\Setup\En\setup_host.exe /s
INSTALLDIR="<Target Installation Directory>"
USER_CONFIG_FILE_PATH="<Full path to UserInput file>" NVINSTALL=Y INSTALL_GATLING=1
INSTALL_JMETER=1
```

### In the above examples:

<full path="" to<br="">UserInput file&gt;</full>	Is the path to your customized UserInput.xml file.
<target installdir&gt;</target 	Is the directory in which to install the LoadRunner Enterprise server or host.
setup.exe	<ul> <li>When using the setup.exe file, the installation log is created under the user's temp directory.</li> <li>Host installation: %temp%\LREHost.log</li> <li>Server installation: %temp%\LREServer.log</li> </ul>
NVINSTALL	Indicates whether to launch the NV installation in silent mode, once the LoadRunner Enterprise installation is done (by default, NV is not installed in silent mode).

INSTALL_	To install Gatling as part of the OneLG installation, add the following to the installation command: INSTALL_GATLING-1	
	By default, Gatling is not installed in silent mode.	
INSTALL_ JMETER	To install JMeter as part of the OneLG installation, add the following to the installation command: INSTALL_JMETER=1	
	By default, JMeter is not installed in silent mode.	
Note: Restartin	<b>Note:</b> Restarting the machine is required in order for NV to function properly.	

### Installing an upgrade in silent mode

If you are installing an upgrade, run the following command:

msiexec.exe /i <full path to msi file> [/qn] [/l\*vx <full path to log file>]

The msi files are located in the installation package.

The **/qn** option sets the silent mode and **/l\*vx** enables logging in verbosity mode.

### Notes and limitations

If you attempt to download Network Virtualization installation files from the Internet or an FTP site, the files are blocked to protect the computer from untrusted files and you get the following message: "This file came from another computer and might be blocked to help protect his computer."

**Resolution:** Before installing NV, unblock the files as follows:

- Right-click one of the NV installation executable files located in <NV installation path>\Additional Components\Network Virtualization, and select Properties.
- 2. If there is an **Unblock** check box in the **General** tab, select it and click **OK**.
- 3. Verify that the **Unblock** check box is gone.
- 4. Repeat for each executable file in the **Network Virtualization** folder.

# **Deploy LoadRunner Enterprise on AWS**

LoadRunner Enterprise is certified to be installed and run under Amazon Web Services (AWS), using a BYOL (Bring Your Own License) model.

Requirements for deploying LoadRunner Enterprise on the cloud:

- All components of the cloud computing environment follow the system requirements specified in this document.
- The required ports are open for communication. For the required posts, see "Communication paths" on page 14.

### Note:

- Cloud load generators can be provisioned using the built-in functionality of LoadRunner Enterprise. For details, see Manage Load Generators on the Cloud in the LoadRunner Professional Help Center and Provision cloud load generators in the LoadRunner Enterprise Help Center. All other components must be manually installed and configured by the user.
- To improve performance, it is preferable to deploy the LoadRunner Enterprise server and hosts, and the database in the same region. Consult AWS for best practices about network performance.
- Cloud load generator ports are configurable. When all the components are in the cloud, the ports to use are defined by the cloud provider (they are not based on internal IT policies).

## Install standalone components (Windows)

You can install standalone components that provide advanced features for working with LoadRunner Enterprise.

To install a load generator on Linux, see "Install a load generator on Linux" on page 92.

**Note:** For all standalone applications, you must first manually install the prerequisite applications. For details, see "Prerequisite software for silent installation" on page 78

### This section includes:

- "Available standalone components for Windows" below
- "Install standalone components" on the next page
- "Silently install standalone applications" on page 90

## Available standalone components for Windows

The following standalone components are available. To install these components, see "Install standalone components" on the next page.

Component	Description
OneLG	Instead of installing a LoadRunner Enterprise Host and then configuring it as a load generator, you can install a standalone version of the load generator (OneLG). This host can behave only as a load generator, unlike the LoadRunner Enterprise host, which can also be configured as a Controller or data processor. You can use a local or a cloud-based machine to host your load generator.
	<b>Note:</b> If you know in advance that a host machine is to be used as a load generator only, we recommend that you install OneLG for the following reasons:
	<ul> <li>The installation requires less disk space</li> </ul>
	<ul> <li>Moving the load generator's setup files is less time consuming than moving the setup files of the LoadRunner Enterprise Host.</li> </ul>
Virtual User Generator	Virtual User Generator (VuGen) generates virtual users, or Vusers, by recording actions that typical end-users would perform on your application. VuGen records your actions into automated Vuser scripts which form the foundation of your performance tests.
LoadRunner Analysis	Analysis provides graphs and reports with in-depth performance analysis information. Using these graphs and reports, you can pinpoint and identify the bottlenecks in your application and determine what changes need to be made to your system in order to improve its performance.

Component	Description
MI Listener	The MI Listener is one of the components needed to run Vusers and monitor applications over a firewall. To install, run <b>SetupMIListener.exe</b> . For details about firewalls in LoadRunner Enterprise, see "Working with firewalls" on page 146.
Monitor Over Firewall Agent	Used to monitor servers that are located over a firewall. For details about firewalls in LoadRunner Enterprise, see "Working with firewalls" on page 146.

## Install standalone components

This section describes the installation process for standalone components.

- 1. From the LoadRunner Enterprise installation directory, run **setup.exe**. The setup program displays the installation menu page.
- Select one of the following options: OneLG, VuGen, Analysis, MI Listener, or Monitors Over Firewall. For details, see the LoadRunner Installation Guide available from the LoadRunner Professional Help Center.

### Note:

 During the installation of Load Generator Standalone, MI Listener, or Monitors over Firewall components, the setup wizard prompts you to select the mode for running the installed agent. Select LoadRunner Enterprise mode.

The agent runs as a service under a special account named **IUSR\_ METRO**. This is a local Windows account, created during the installation process (some additional LoadRunner Enterprise configuration is also added on the load generator).

You can delete the **IUSR\_METRO** account only if the LoadRunner Enterprise system user was configured to a different Windows account; otherwise the host does not function correctly.

 If you attempt to install standalone components on a system drive other than the default C drive, you get a warning that you are out of disk space on your system drive even though you are not installing there. This is because the installer, while installing the components to the drive as specified by the user, still needs to use the Windows temporary file locations during installation.Solution: Free up space on your C system drive.

 (MI Listener/Monitors Over Firewall installations only) Follow the instructions in the installation wizard. After installation, the configuration wizard opens, requesting the name of the product you are working with. Select LoadRunner Enterprise.

## Silently install standalone applications

This section describes how to perform a silent installation of the standalone applications.

**Note:** For instructions on installing the Load Generator silently on Linux, see the *LoadRunner Installation Guide* available from the LoadRunner Professional Help Center.

Choose one of the following options:

- "Option 1: Install the prerequisite software and the application separately" below
- "Option 2: Install the prerequisite software and the application together" on the next page

# Option 1: Install the prerequisite software and the application separately

- 1. Install required prerequisite software. For details, see "Prerequisite software for silent installation" on page 78.
- 2. Extract the Load Generator installation files to a local directory:
  - a. Select an application from the **<installdir>\Standalone Applications** folder.
  - b. Extract the **.msi** file from the **.exe** application to the installation folder.
- 3. Run one of the following commands from the command line:

### Load Generator:

```
msiexec /i "<installdir>\OneLG_x64.msi" /qb /l*vx "<Path to log file>" IS_RUNAS_
SERVICE=1 START_LGA="1"
```

#### VuGen Standalone:

msiexec /i "<installdir>\VuGen\_x64.msi" /qb /l\*vx "<Path to log file>"

#### Analysis Standalone:

msiexec /i "<installdir>\Analysis\_x64.msi" /qb /l\*vx "<Path to log file>"

where **<installdir>** is the local directory where you saved the installation files, and **<Path to log file>** is the full path to the installation log file.

**Note:** You can install the Load Generator component on a Linux platform to run virtual users. The Linux virtual users interact with the Controller, installed on a Windows machine. For details on installing the Load Generator on Linux, see the *LoadRunner Installation Guide* available from the LoadRunner Professional Help Center.

# Option 2: Install the prerequisite software and the application together

- Select an application from the <installdir>\Additional
   Component\Applications folder.
- 2. Run one of the following commands from the command line:

Load Generator:

SetupOneLG.exe -s -sp"/s" IS\_RUNAS\_SERVICE=1 START\_LGA=1 NVINSTALL=Y

VuGen Standalone:

SetupVuGen.exe /s /a /s INSTALLDIR="c:\OpenText\VuGen\_SA"

Analysis Standalone:

SetupAnalysis.exe /s /a /s

# Install a load generator on Linux

You can install the ILoad generator component on a Linux platform to run virtual users. The Linux virtual users interact with the Controller, installed on a Windows machine. For details on installing the load generator on Linux, see the *LoadRunner Installation Guide* available from the LoadRunner Professional Help Center.

# Deploy Dockerized load generators on Linux

This section describes how to run a Dockerized load generator on a Linux distribution.

Docker is a platform that allows you to develop, ship, and run applications using a container. Refer to the product documentation for more details.

**Note:** For supported protocols on Dockerized load generators, see the **Supported Protocols** guide.

## Prerequisites

Below is a list of prerequisites that are required to run a Dockerized load generator on a Linux distribution:

Install Install Docker on the target machine, along with its dependencies, and set up the target machine environment as required. Currently, only the 64-bit version is supported.

Obtain Obtain the predefined load generator Docker image. Two images are available, Linux-Ubuntu and RHEL. Docker image Pull the image from the from the relevant page, accessible from the performance testing page (https://hub.docker.com/u/performancetesting) in the Docker hub. Use the following commands and appropriate <tag version number>, for example, 24.3: Linux-Ubuntu: docker pull performancetesting/opentext onelg ubuntu:<tag version number> RHEL: docker pull performancetesting/opentext onelg rhel:<tag version number> **Note:** The Ubuntu image for the OneLG load generator replaces the

# Run a Dockerized load generator using the predefined image

previous Ubuntu load generator docker image.

Use the ready-to-use image to run a load generator on Docker for Linux. If you need customization for your container, for example, for proxy servers, see "Run a Dockerized load generator using a custom image" on page 95.

### Note:

- The following environment variables are available to enable JMeter and Gatling on the load generator if required:
  - ENABLE\_JMETER
  - ENABLE\_GATLING
- If one Docker load generator is configured with either JMeter or Gatling scripts or both, then all Dockers load generators get these flags as well, even if they are configured with other scripts types.

## To run a Dockerized load generator:

Run the load generator container using the following command for Linux-Ubuntu or RHEL:

### Linux-Ubuntu

```
docker run -id -p <host_port>:54345 -e "ONELG_FLAVOR=1" -e "ENABLE_GATLING=1" -e
"ENABLE_JMETER=1" --net=host performancetesting/opentext_onelg_ubuntu:<tag version
number>
```

#### RHEL

```
docker run -id -p <host_port>:54345 -e "ENABLE_GATLING=1" -e "ENABLE_JMETER=1"
performancetesting/opentext_onelg_rhel:<tag version number>
```

**Note:** Check that the <host\_port> on the Linux machine is available and allows incoming requests. Specify this port on the Controller side when connecting to this load generator.

### **Example using SSH**

The following gives a simple C# code example for running multiple load generator containers using SSH. There are container orchestrator tools which do the same, for example, Kubernetes.

```
using (var client = new SshClient(dockerHost, dockerHostUserName, dockerHostPasswd))
{
    client.Connect();
    for (int i =0; i > numOfContainers; i++)
    {
        string command = "docker run -id -p " + lgInitialPort + i) + ":54345
performancetesting/opentext_onelg_ubuntu:<tag version number>";
        var terminal = client.RunCommand(command);
        if (terminal.ExistStatus != 0)
        {
            throw new Exception("Failed to create new Docker container");
        }
        Console.WriteLine("Docker LG with external port" + lgInitialPort + i + "created.");
    }
```

Installation Guide Installation and configuration

```
client.Disconnect();
```

}

## Run a Dockerized load generator using a custom image

If your environment requires customized settings for running the container, for example for proxy servers, you can create a Dockerfile to build a custom image.

**Note:** Another alternative for customized settings: Start the container; once it is running, set up the load generator environment variables, then start the load generator manually inside the container.

### To run a custom Dockerized load generator:

 Create a new folder, and within it create a file named dockerfile. Paste the FROM line, plus the required customization lines, into the file, using the appropriate LoadRunner Enterprise version for the <tag version number>:

FROM performancetesting/opentext\_onelg\_ubuntu:<tag version number>ENV http\_proxy
http://my\_proxy\_name:port

**Note:** The above customization example is for a proxy. It defines an environment variable for the proxy server host and port in the target image.

- 2. Save the Dockerfile.
- 3. Open a command line at the **dockerfile** folder path and run the following command, using the name you want for your custom image:

Linux-Ubuntu:

docker build -t <custom dockerfile name> .

### RHEL:

docker build -t <custom dockerfile name> .

4. Create a container for each load generator you want to use, by running the following command:

#### Linux-Ubuntu:

docker run -id -p <host\_port>:54345 <custom image name>

RHEL:

docker run -id -p <host\_port>:54345 <custom image name>

If the custom image in step 3 was built with a tag then include it in the command:

docker run -id -p <host\_port>:54345 <custom image name>:<tag version number>

**Note:** Check that the <host\_port> on the Linux machine is available and allows incoming requests. Specify this port on the Controller side when connecting to this load generator.

## After running the load generator containers

Add the load generators containers to your tests.

- For elastic hosts, see Set up elastic hosts on Windows or Linux containers in the LoadRunner Enterprise Help Center.
- For manually configure Dockerized load generators, see Add Dockerized hosts to your tests in the LoadRunner Enterprise Help Center.

## Tips and guidelines

• Dockerized load generators, run from the predefined image, are not supported when running over a firewall. (Solution for advanced users: You can develop your

own Docker image with MI Listener support.)

- Use docker ps to list the containers that are running.
- To stop the load generator service:
  - Use docker stop <load generator container name or ID> if you want to reuse the same load generator.
  - Use docker rm -f <load generator container name or ID> in order to remove the load generator container.
- The Dockerfile container has an ENTRYPOINT section. The container first runs the commands in ENTRYPOINT. It sets up the environment and then starts the load generator. The command uses a While loop to wait for input, in order to keep the container from exiting. This behavior prevents you from accessing the container while it is running. Add -i when starting the container to prevent the While loop from consuming an excessive amount of CPU.
- If you need entry into the container, add an argument such as -entrypoint=/bin/bash when starting the container. After entering the
  container, set the load generator environments and start the load generator. You
  can then switch to the host using CTRL+p and CTRL+q while keeping the
  container running in the background. To access the container again, use the
  docker attach container\_id command.
- To access the host network directly, use --net=host in place of -p <host\_ port>:54345. We recommend you use this flag if the AUT generates a lot of network activity.

## Deploy Dockerized load generators on Windows

This section describes how to run a Dockerized load generator on a Windows platform.

Docker is a platform that allows you to develop, ship, and run applications using a container. Refer to the product documentation for more details.

**Note:** For supported protocols on Dockerized load generators, see the **Supported Protocols** guide.

## Prerequisites

Below is a list of prerequisites that are required to run a Dockerized load generator on a Windows platform:

Install Docker	Install Docker on the target machine, along with its dependencies, and set up the target machine environment as required. Currently, only the 64-bit version is supported.
Obtain Docker image	Pull the Windows load generator Docker image accessible from the performance testing page (https://hub.docker.com/u/performancetesting) in the Docker hub.
	Use the following command and appropriate <tag number="" version="">, for example, 24.3:</tag>
	<pre>docker pull performancetesting/opentext_onelg_windows:<tag number="" version=""></tag></pre>
	<b>Note:</b> The Docker image for the OneLG load generator replaces the previous Windows standalone load generator docker image.

# Run a Dockerized load generator using the predefined image

Use the ready-to-use image to run a load generator (OneLG) on Docker for Windows. If you need customization for your container, for example, for Java or to run under a specific user, see "Run a Dockerized load generator using a custom image" on the next page.

### Note:

- The following environment variables are available to enable JMeter and Gatling on the load generator if required:
  - ENABLE\_JMETER
  - ENABLE\_GATLING
- Since Java is not installed in the Windows OneLG load generator image, you need to build a customized image with Java to run JMeter or Gatling scripts.
- If one Docker load generator is configured with either JMeter or Gatling

scripts or both, then all Dockers load generators get these flags as well, even if they are configured with other scripts types.

### To run a Dockerized load generator:

Run the load generator container using the following command:

docker run -id -p <host\_port>:54345 -e "ENABLE\_GATLING=1" -e "ENABLE\_JMETER=1"
performancetesting/opentext\_onelg\_windows:<tag version number>

**Note:** Check that the <host\_port> on the machine is available and allows incoming requests. You specify this port on the Controller side when connecting to this load generator.

## Run a Dockerized load generator using a custom image

If your environment requires customized settings for running the container, you can create a Dockerfile to build a custom image for Docker on Windows.

Examples for custom images:

- To use a specific user account for the processes under which the Vusers are running, to provide support for accessing network resources like script parameter files. After running, the container should be able to verify the user.
- To run Java, Gatling, or JMeter protocols on Windows load generator containers.
- To define environment variables for proxy server host and port.

### To run a custom Dockerized load generator:

 Create a new folder, and within it create a file named **dockerfile**. Paste the following **FROM** line into the file, using the appropriate LoadRunner Enterprise version for the **<tag version number>**, and add the relevant customization lines:

FROM performancetesting/opentext\_onelg\_windows:<tag version number><Customization
lines>

For customization examples, see "Examples of customized content for Dockerfiles " below

**Tip:** Refer to the Docker documentation for commands that can be used in Docker files.

- 2. Save the Dockerfile.
- 3. Open a command line at the **dockerfile** folder path and run the following command, using the name you want for your custom image:

docker build -t <custom dockerfile name> .

4. Create a container for each load generator you want to use, by running the following command (or use any Docker orchestrator tool for running containers):

```
docker run -id -p <host_port>:54345 <custom image name>
```

If the custom image in step 3 was built with a tag then include it in the command:

docker run -id -p <host\_port>:54345 <custom image name>:<tag version number>

**Note:** Check that the <host\_port> on the machine is available and allows incoming requests. You specify this port on the Controller side when connecting to this load generator. This is not relevant when using elastic load generators, because this is managed by the orchestrator.

## Examples of customized content for Dockerfiles

The following gives an example of dockerfile content for running the Vusers under a specified user account with network access to shared locations. Replace the values between <> with credentials for a valid user account in your environment, with network access to the shared resources. Example for Vusers under a specified user account:

#### #escape=`

FROM performancetesting/opentext\_onelg\_windows:24.3

RUN c:\LG\launch\_service\bin\magentservice.exe -remove

RUN c:\LG\launch\_service\bin\magentservice -install <domain>\<user name> <password>

Example of dockerfile content for running Java protocols:

#escape=`

FROM performancetesting/opentext\_onelg\_windows:24.3

COPY .\<folder contains JDK> <target path in the container>

The path to the target JDK directory defined in the **COPY** line for the **<target path in the container>** must also be added to the **Java VM** runtime settings page:

**Note:** For Java 64-bit protocol testing, include the following command line in the dockerfile, in order to add the path to the **bin** folder for the JDK 64-bit to the machine PATH environment variable:

```
RUN powershell [Environment]::SetEnvironmentVariable(\"Path\",
$env:Path + \";<target JDK path in the container>\bin\",
[EnvironmentVariableTarget]::Machine)
```

## After running the load generator containers

Add the load generators containers to your tests.

- For elastic hosts, see Set up elastic hosts on Windows or Linux containers in the LoadRunner Enterprise Help Center.
- For manually configure Dockerized load generators, see Add Dockerized hosts to your tests in the LoadRunner Enterprise Help Center.

**Note:** This is not relevant when using orchestrators.

## Tips and guidelines

- Dockerized load generators, run from the predefined image, are not supported when running over a firewall.
- Use docker ps to list the containers that are running.
- To stop the load generator service:
  - Use docker stop <load generator container name or ID> if you want to reuse the same load generator.
  - Use docker rm -f <load generator container name or ID> in order to remove the load generator container.
- To access the host network directly, use --net=host in place of -p <host\_ port>:54345. We recommend you use this flag if the AUT generates a lot of network activity.

# Install additional components

You can install additional components that provide advanced features for working with LoadRunner Enterprise. You install these components from the **Additional Components** directory, located in the root directory of the installation directory. The following components are available:

Component	Description
Agent for Citrix Server	Installs an optional component on the server machine that enhances VuGen's capabilities in identifying Citrix client objects.
Agent for Microsoft Terminal Server.	Used for extended RDP protocol record-replay. This component runs on the server side, and is used to create and run enhanced RDP scripts.
Assembly Crawler for Analysis API	Installs a command-line utility to build a .NET configuration file for a LoadRunner Analysis API application. For details, refer to the Analysis API Reference.

## Installation Guide Installation and configuration

Component	Description
Azure API Service	Installs the Azure API Service on Windows machines, which enables you to run Vuser scripts that include Azure API functions. For details, see the LoadRunner Professional Help Center.
Entity Unlocker	Installs a utility that enables users to unlock tests, scripts, monitor profiles, and analysis templates for editing when locked by that user in another session. It also enables administrators to unlock entities that have been locked by other users. For details, see Unlock entities and manage unlocking jobs in the LoadRunner Enterprise Help Center.
IDE Add-ins	Installs add-ins for Visual Studio or Eclipse, enabling you to create NUnit or JUnit tests in your standard development environment using the LoadRunner API.
Network Virtualization	Network Virtualization (NV) integrates with LoadRunner Enterprise to help you test point-to-point performance of network-deployed products under real-world conditions. For details, see the Network Virtualization for LoadRunner Help.
SAP Tools	The following SAP tools are available:
	<ul> <li>SAPGUI Spy. Examines the hierarchy of GUI Scripting objects, on open windows of SAPGUI Client for Windows.</li> <li>SAPGUI Verify Scripting. Verifies that the SAPGUI Scripting API is enabled.</li> </ul>
Third Parties	Includes the source code for open-source packages that are incorporated into LoadRunner Enterprise, and which have licenses with source distribution clauses.
Virtual Table Server	Virtual Table Server (VTS) is a web-based application that works with Vuser scripts. VTS offers an alternative to standard parameterization.
	Two versions of VTS are available: 32-bit and 64-bit. You can install 32-bit VTS on both 32-bit and 64-bit operating systems; 64-bit VTS can be installed only on 64-bit operating systems.
VuGen Script Converter	Installs the VuGen Script Converter that enables converting NUnit/JUnit tests to VuGen scripts in order to run them in LoadRunner Enterprise.

# Uninstall LoadRunner Enterprise server and hosts

You can uninstall LoadRunner Enterprise servers and hosts using the LoadRunner Enterprise Setup Wizard or using the silent commands.

## Note:

- When uninstalling earlier versions of LoadRunner Enterprise, the Network Virtualization components installed during the installation are automatically uninstalled.
- For cluster environments: Uninstall LoadRunner Enterprise from all nodes.

# To uninstall LoadRunner Enterprise components using the setup wizard:

- 1. From the Windows Control Panel, open the Add/Remove Programs dialog box.
- 2. From the list of currently installed programs, select the program you want to uninstall, and click **Remove**.
  - LoadRunner Enterprise <product version> for LoadRunner Enterprise server
  - LoadRunner <product version> for LoadRunner Enterprise hosts
- 3. Follow the instructions in the wizard to complete the uninstall process.

## To uninstall LoadRunner Enterprise components silently:

Run the applicable command from the command line:

### LoadRunner Enterprise Server:

```
msiexec.exe/uninstall "<Installation_Disk_Root_Directory>\Setup\Install\Server\LRE_
Server.msi" /qnb
```

#### LoadRunner Enterprise Host:

```
msiexec.exe/uninstall "<Installation_Disk_Root_Directory>\Setup\Install\Host\LoadRunner_
x64.msi" /qnb
```

## Uninstall the load generator from Linux

You can use the Load Generator Setup Wizard to uninstall the load generator. For details, see the *LoadRunner Professional Installation Guide* available from the LoadRunner Professional Help Center.

# Post-installation verification

This section describes how to verify that the installation of the LoadRunner Enterprise server and hosts was successful. The environment for this process should be a staging environment, including a LoadRunner Enterprise server and two to three LoadRunner Enterprise hosts.

**Note:** You can run a full validation on your LoadRunner Enterprise system from LoadRunner Enterprise Administration, in the System Health page's Check System tab. For details, see <u>Maintain system health</u> in the LoadRunner Enterprise Help Center.

### Administrator workflow

This section describes the workflow for the LoadRunner Enterprise administrator.

1. Log onto LoadRunner Enterprise Administration.

For details, see Log onto LoadRunner Enterprise Administration in the LoadRunner Enterprise Help Center.

2. Create a project administrator user.

For details, see Create a new user in the LoadRunner Enterprise Help Center.

3. Create a domain.

For details, see Create a domain in the LoadRunner Enterprise Help Center.

4. Create a new project.

Follow the steps to create the project in Create a project in the LoadRunner Enterprise Help Center, and:

- a. In the **Domain Name** list, select the domain you just created.
- b. Skip the **Main Details** for now (you define them after adding a host and host pool in step 9).
- c. Assign the project administrator user you created above to the Users list.
- 5. Assign more project administrators to the project optional.

- a. Select **Management > Projects**, and in the projects list, click the name of project you created to display the project details.
- b. Click the **Users** tab, and assign another project administrator user.
- 6. Verify the LoadRunner Enterprise configuration.

On the LoadRunner Enterprise Administration sidebar,

- Under **Configuration**, select **Servers** and verify that the LoadRunner Enterprise Server is listed.
- Under **Configuration**, select **Licenses** and verify the license details.
- 7. Define additional hosts for the staging environment.

For the staging environment, you should have two to three LoadRunner Enterprise hosts, where at least one host purpose is configured as Controller, and at least one host purpose is configured as Load Generator.

**Note:** When adding hosts, fields in red marked with an asterisk (\*) are mandatory. Make sure to include the operating system type, and the purpose of the host. For details, see Manage hosts in the LoadRunner Enterprise Help Center.

- a. On the LoadRunner Enterprise Administration sidebar, under **Maintenance**, select **Hosts**.
- b. Click the **Add Host** 🕀 button, and define the host details.
- 8. Create host pools.
  - a. On the LoadRunner Enterprise Administration sidebar, select Maintenance
    > Hosts, and click the Pools tab.
  - b. Click the **Add Pool** (1) button. The New Pool page opens, enabling you to define a new host pool.
  - c. Add a name and description (optional) for the host pool.
  - d. In the Linked Hosts grid, select the hosts to add to the pool, and click
     Assign. The selected hosts are added to the pool.
- 9. Define project settings.

- a. On the LoadRunner Enterprise Administration sidebar, select **Management > Projects**.
- b. Under the **Project Name** column, click the project to display the project details.
- c. In the **Main Details** tab, finish defining the project's settings. In particular, set the Vuser limit, Host limit, and Concurrent run limit. Also, select the host pool you created above for the project.
## **Configuration options**

The LoadRunner Enterprise system comes with default configuration settings that enable you to use LoadRunner Enterprise for its intended purpose. This chapter describes additional tuning and configuration to help you get the most out of your system.

**Note:** Not all procedures in this chapter are suitable for all usage scenarios. You should assess which procedures are suitable to your system's needs.

This chapter includes:

Configure LRE servers and hosts to work with TLS/SSL	
Configure LoadRunner components to work with TLS/SSL	
Configure load generators to work with TLS/SSL	
Working with the LoadRunner Enterprise Agent	
LoadRunner Remote Management Agent	
Configure Linux load generators	
Change load generator TEMP folder	
Download standalone applications	
Enable MS-SQL Windows authentication	

# Configure LRE servers and hosts to work with TLS/SSL

The following section describes how to enable TLS to ensure secure communication on LoadRunner Enterprise. It includes:

- "TLS/SSL configuration workflow" below
- "Configure IIS to work with TLS/SSL" on page 112
- "Distribute certificates" on page 114
- "Configure LRE servers to work with TLS/SSL" on page 115
- "Configure LRE hosts to work with TLS/SSL" on page 118

**Tip:** For additional information and examples on how to configure secure communication on LoadRunner Enterprise components, see our blog series:

- Configure LoadRunner Enterprise Server to support SSL
- Configure LoadRunner Enterprise Host to support SSL

## TLS/SSL configuration workflow

This section describes the workflow for configuring the LoadRunner Enterprise server and hosts to work over TLS. You can configure both the LoadRunner Enterprise server and hosts, or the LoadRunner Enterprise server only.

For the LoadRunner Enterprise	1.	Configure IIS
		For details, see "Configure IIS to work with TLS/SSL" on the next page.
Server	2.	Add the root certificate to the machine truststore
		For details, see "Distribute certificates" on page 114.
	3.	Configure the LoadRunner Enterprise server to work with TLS/SSL
		<ul> <li>Replace the certificates* on the LoadRunner Enterprise server. For details, see "Configure LoadRunner components to work with TLS/SSL" on page 123.</li> </ul>
		<ul> <li>b. Update and replace the relevant configuration files (update pcs.config internalUrl with https URL and replace web.config). For details, see "Configure LRE servers to work with TLS/SSL" on page 115.</li> </ul>
		c. Restart the LoadRunner Backend Service and IIS.
		d. Update the internal and external URLs with the "https" URL.
For	1.	Add certificates to the machine truststore
LoadRunner		For details, see "Distribute certificates" on page 114.
Enterprise Hosts	2.	Configure LoadRunner Enterprise hosts and load generators to work with TLS/SSL
		a. Replace the certificates* on LoadRunner Enterprise hosts and load generators. For details, see "Configure load generators to work with TLS/SSL" on page 124.
		<ul> <li>b. Configure secure communication on a LoadRunner Enterprise host. For details, see "Configure LRE hosts to work with TLS/SSL" on page 118.</li> </ul>

\*The certificate files within the **<installdir>\dat\cert** folder should have the exact names of **cert.cer** and **verify\cacert.cer**, no matter if they are the default ones provided as part of the installation, or if they are your company certificates. The certificate names should be the same for all LoadRunner Enterprise components:LoadRunner Enterprise servers, hosts, and load generators.

## Configure IIS to work with TLS/SSL

This section describes the basic steps involved in setting up IIS (Microsoft Internet Information Server) on the LoadRunner Enterprise server machine to use TLS/SSL.

IIS is a prerequisite software for LoadRunner Enterprise servers. You can configure the IIS LoadRunner Enterprise virtual directories (LoadRunner Enterprise server and host) to use TLS/SSL.

For LoadRunner Enterprise hosts, the root certificate of the CA should appear in the Microsoft Management Console under **Certificates (Local Computer) > Trusted Root Certification Authorities**. For details, see "Distribute certificates" on page 114.

To configure IIS to use TLS/SSL on the LoadRunner Enterprise server machine, you need to perform the following:

1. Perform the following before you configure IIS:

Support latest TLS versions	Configure your servers to support the latest TLS versions to ensure you are using only the strongest cryptographic protocols. Deactivate old SSL and TLS versions (SSLv2, SSLv3, TLS 1.0, and TLS 1.1) on IIS and on your operating system.
Disable ciphers on TLS 1.2	If you are using TLS 1.2, we recommend deactivating the 3DES and RC4 ciphers on Windows servers by removing them from the <b>HKEY_LOCAL_</b> <b>MACHINE\SYSTEM\CurrentControlSet\Control\</b> <b>Cryptography\Configuration\Local\SSL\00010002</b> registry. To check the list of the ciphers on a machine, run the Get-TlsCipherSuite command in PowerShell.
Make port 443 available for IIS	Make sure port 443 on the LoadRunner Enterprise server is available for use by IIS. IIS uses port 443 to work with TLS/SSL. If other LoadRunner Enterprise components are also configured to use this port, configure them to use a different port. <b>Note:</b> As of LoadRunner Enterprise 2022 R1, the Remote Management agent for the LoadRunner Enterprise server was moved to port 3333. However, the agent still uses port 443 for hosts and OneLGs. Use the Network and Security Manager tool to change the port being used by the agent to a different port. For details, see the LoadRunner Professional Help Center.
Prevent host header injection	Prevent host header injection in a Server-Side Request Forgery (SSRF) attack. We recommend configuring the HTTPS communication and IIS host binding for all relevant protocols. These configurations are not provided by OpenText by default. <b>Note:</b> By not implementing secure configuration and proper hardening of the IIS you may expose the system to increased security risks.

2. Obtain a server certificate issued to the fully qualified domain name of your LoadRunner Enterprise server.

3. Configure IIS to work with TLS/SSL.

Update IIS with the https binding (the same port as you used in step 1 above) and remove the http binding.

- a. Open IIS Manager, and select Server Home > Server Certificates > Import.
- b. Import the server certificate (in pfx format) that you obtained above.
- c. In the **Actions** pane, click **Bindings**. and then click **Add** in the Site Bindings window.
- d. In the Edit Site Binding dialog box, configure the following:
  - Type: https
  - ° IP address: All Unassigned
  - ° Port: 444
  - SSL Certificate: \*.<your domain name>

Refer to the product documentation for more details.

### Distribute certificates

Add the root certificate to the machine truststore on the LoadRunner Enterprise server, LoadRunner Enterprise hosts, and OneLG standalone load generators.

- 1. Extract the contents from the domain certificate in .pfx format to the personal truststore of the host.
- 2. Add the CA certificate to the machine's truststore.

If your are using a secure connection for the internal URL of the LoadRunner Enterprise server, you need to establish trust to the Certificate Authority (CA) that issued your LoadRunner Enterprise server certificate.

a. Run the following command to update the certificates using MMC (Microsoft Management Console):

run mmc.exe

b. In the console, select **Run > Add/Remove Snap-in**.

- c. From the list of available snap-ins, select **Certificates** and click **Add**.
- d. In the Certificates snap-in dialog box, select **Computer account**, and then click **Next**.
- e. In the Console Root tree, expand **Trusted Root Certification Authorities**. Right-click **Certificates** and select **All Tasks > Import**.
- f. In the Certificate Import Wizard, click Next.
- g. Click **Browse**, and go to the unzipped certs folder. Select **PCSecureEnvTestingCA** certificate, and click **Open**.
- h. Click **Next** in the certificate stores page of the wizard, and then click **Finish**. Wait for the import success message.
- 3. Repeat on all LoadRunner Enterprise machines.
- 4. (For LoadRunner Enterprise hosts used as Controllers only) Import the domain certificate in .pfx format to the personal truststore of the host.

### Configure LRE servers to work with TLS/SSL

This section explains how to configure secure communication on a LoadRunner Enterprise server for incoming requests from the LoadRunner Enterprise server and hosts.

To configure the LoadRunner Enterprise server to use TLS/SSL, you need to perform the following:

- Update the web.config file located in the <LRE\_server\_installdir>\PCS directory.
  - a. Create a backup copy of the **web.config** file and save it in a different folder.
  - b. To update the web.config file, you can replace it with the predefined web.config-for\_ssl file. See step 1d below.

If you have manual changes you want to preserve in the **web.config** file, you can manually modify the file. See step **1c** below.

c. Edit the web.config file. Under the <system.servicemodel><services> tag, there are eight areas where the following comment appears:
 Uncomment to enable SSL. Uncomment the XML lines which appear

## thereafter, and comment the non-TLS/SSL settings as shown in the example below.

### Example before:

<endpoint binding="basicHttpBinding" contract="HP.PC.PCS.ILabService"><identity>

<dns value="localhost"/></identity></endpoint>

<endpoint address="mex" binding="mexHttpBinding" contract="IMetadataExchange"/>

<!- Uncomment to enable TLS/SSL ->

<!-- endpoint binding="basicHttpBinding" bindingConfiguration="BasicHttpBinding\_ TransportSecurity" contract="HP.PC.PCS.ILabService"><identity>

<dns value="localhost"/></identity></endpoint -->

### Example after:

```
<!--<endpoint binding="basicHttpBinding"
contract="HP.PC.PCS.ILabService"><identity>
<dns value="localhost"/></identity></endpoint>
<endpoint address="mex" binding="mexHttpBinding" contract="IMetadataExchange"/> -
> <!-- Uncomment to enable TLS/SSL -->
<endpoint binding="basicHttpBinding" bindingConfiguration="BasicHttpBinding_
TransportSecurity" contract="HP.PC.PCS.ILabService"><identity>
<dns value="localhost"/></identity></endpoint>
```

Under the **<system.servicemodel><behaviors>** tag, there are seven areas where you need to change the **httpGetEnabled** parameter to **false**, and the **httpsGetEnabled** parameter to **true**.

### Example before:

<serviceMetadata httpGetEnabled="true" httpsGetEnabled="false" />

### Example after:

<serviceMetadata httpGetEnabled="false" httpsGetEnabled="true" />

d. To replace web.config with the predefined web.config-for\_ssl file, copy web.config-for\_ssl from the <LRE\_server\_ installdir>\conf\httpsConfigFiles directory and place it under the <LRE\_ server\_installdir>\PCS directory.

Rename web.config-for\_ssl to web.config.

 Open the PCS.config file, located in the <LRE\_server\_installdir>\dat path, and update the Internal URL attribute with https to connect to LoadRunner Backend Service through a secure port:

```
internalUrl="https://<lre-dns-name>:444"
```

3. Update the LoadRunner Enterprise server to ensure that communication with the host is secure (only required when you plan to configure hosts to work with TLS/SSL)

If the LoadRunner Enterprise host is secured, edit the **PCS.config** file located in the **<LRE\_server\_installdir>\dat** path, by changing the value of the **ItopIsSecured** parameter to **true**.

### Example before:

<PCSSettings ltopPortNumber="8731" ltopIsSecured="false" StartRunMaxRetry="3" DataProcessorPendingTimeoutMinutes="2880"/>

### Example after:

<PCSSettings ltopPortNumber="8731" ltopIsSecured="true" StartRunMaxRetry="3" DataProcessorPendingTimeoutMinutes="2880"/>

- 4. Restart the LoadRunner Backend Service.
- 5. Restart IIS.
- 6. In LoadRunner Enterprise Administration, update the LoadRunner Enterprise server internal and external URLs with the https URL.

## Configure LRE hosts to work with TLS/SSL

This section explains how to configure secure communication on a LoadRunner Enterprise host for incoming requests from LoadRunner Enterprise servers.

### Configure the LoadRunner Enterprise hosts

1. The default port used by a LoadRunner Enterprise host service is 8731. Refer to the Microsoft documentation for details on configuring a port with an SSL certificate.

**Note:** Server certificates for all LoadRunner Enterprise host machines must be installed and trusted on all servers that are part of the environment. This requires:

- Binding port 8731 on each host to its respective certificate.
- Ensuring the LoadRunner Enterprise server certificate within the <LRE\_server\_installdir>\dat\cert folder contains the private key and the intermediate CA certificates (in the order that they appear in the chain) on all systems.

Below are examples of the steps described in the above link.

a. Check that the port is not configured:

### Example:

C:\Users\Demo>netsh http show sslcert ipport=0.0.0.0:8731 SSL Certificate bindings: ..... The system cannot find the file specified.

b. Run the netsh command:

You can use the command below (where certhash is the certificate thumbprint and the appid parameter is a GUID that can be used to identify the owning application. You can use any valid GUID. There are many tools that can generate a GUID).

### Example:

```
C:\Users\Demo>netsh http add sslcert ipport=0.0.0.0:8731
certhash=1b337c1f17e0f96b09f803fs0c2c7b3621baf2bb appid={114F6E0C-EB01-4EE9-9CEF-
3D1A500FD63F}
```

```
SSL Certificate successfully added
```

c. Check that the port is now configured:

```
Example:
C:\Users\Demo>netsh http show sslcert ipport=0.0.0.0:8731
 SSL Certificate bindings:
 _____
                  : 0.0.0.0:8731
 IP:port
 Certificate Hash
                        : 1b337c1f17e0f94b09f803ff0c2c7b7621baf2bb
                         : {114f6e0c-eb01-4ee9-9cef-3d1a500fd63f}
Application ID
 Certificate Store Name : (null)
 Verify Client Certificate Revocation : Enabled
 Verify Revocation Using Cached Client Certificate Only : Disabled
 Usage Check
                         : Enabled
 Revocation Freshness Time : 0
URL Retrieval Timeout : 0
Ctl Identifier : (null)
                         : (null)
 Ctl Store Name
                         : Disabled
 DS Mapper Usage
 Negotiate Client Certificate : Disabled
```

- 2. Perform the following steps to update the **LTOPSvc.exe.config** file:
  - a. Create a backup copy of the LTOPSvc.exe.config file, and save it in a different folder. The file is located under the <installdir>\bin\LTOPbin directory.
  - b. To update the **LtopSvc.exe.config** file, you can replace it with the predefined **LTOPSvc.exe.config-for\_ssl file**. See step **2d** on page 123.

If you have manual changes you want to preserve in the **LTOPSvc.exe.config** file, you can manually modify the file. See step **2c** below.

 c. Under the <system.servicemodel><bindings><basicHttpBinding> tag, there are two areas where the following comment appears: Uncomment to enable SSL. Uncomment the XML lines which appear thereafter.

```
Example before:
 <binding name="BasicHttpBinding_ILoadTestingService" closeTimeout="00:10:00"</pre>
              openTimeout="00:01:00" receiveTimeout="00:20:00"
 sendTimeout="00:10:00"
              allowCookies="false" bypassProxyOnLocal="false"
 hostNameComparisonMode="StrongWildcard"
              maxBufferSize="2147483647" maxBufferPoolSize="2147483647"
 maxReceivedMessageSize="2147483647"
              messageEncoding="Text" textEncoding="utf-8" transferMode="Buffered"
              useDefaultWebProxy="true">
     <readerQuotas maxDepth="2147483647" maxStringContentLength="2147483647"
 maxArrayLength="2147483647"
           maxBytesPerRead="2147483647" maxNameTableCharCount="2147483647" />
     <!-- Uncomment to enable TLS/SSL -->
     <!--<security mode="Transport">
        <transport clientCredentialType="None"/>
     </security>-->
 </binding>
```

### Example after:

```
<br/><binding name="BasicHttpBinding_ILoadTestingService" closeTimeout="00:10:00"
openTimeout="00:01:00" receiveTimeout="00:20:00"
sendTimeout="00:10:00"
allowCookies="false" bypassProxyOnLocal="false"
hostNameComparisonMode="StrongWildcard"
maxBufferSize="2147483647" maxBufferPoolSize="2147483647"
maxReceivedMessageSize="2147483647"
```

Under the **<system.servicemodel><services>** tag, switch between the non-secured and secured endpoints and base addresses.

#### Example before:

```
<endpoint contract="HP.PC.LTOP.Services.ILoadTestingService"</pre>
address="LoadTestingService" name="basicHttp" binding="basicHttpBinding"
bindingConfiguration="BasicHttpBinding_ILoadTestingService"/>
        <!-- Use the first endpoint for regular communication and the second
endpoint for TLS/SSL -->
        <endpoint contract="IMetadataExchange" binding="mexHttpBinding"</pre>
name="mex" />
        <!--<endpoint contract="IMetadataExchange" binding="mexHttpsBinding"
name="mex" />-->
        <host>
          <baseAddresses>
            <!-- Use the first address for regular communication and the second
address for TLS/SSL -->
            <add baseAddress="http://localhost:8731/LTOP/LoadTestingService"/>
            <!--<add
baseAddress="https://localhost:8731/LTOP/LoadTestingService"/>-->
          </baseAddresses>
        </host>
      </service>
```

### Example after:

```
<service name="HP.PC.LTOP.Services.LoadTestingService"</pre>
behaviorConfiguration="CommonBasicHTTPBehavior">
        <endpoint contract="HP.PC.LTOP.Services.ILoadTestingService"</pre>
address="LoadTestingService" name="basicHttp" binding="basicHttpBinding"
bindingConfiguration="BasicHttpBinding_ILoadTestingService"/>
        <!-- Use the first endpoint for regular communication and the second
endpoint for TLS/SSL -->
        <!-- <endpoint contract="IMetadataExchange" binding="mexHttpBinding"
name="mex" />-->
        <endpoint contract="IMetadataExchange" binding="mexHttpsBinding"</pre>
name="mex" />
        <host>
          <baseAddresses>
            <!-- Use the first address for regular communication and the second
address for TLS/SSL -->
            <!--<add
baseAddress="http://localhost:8731/LTOP/LoadTestingService"/>-->
            <add baseAddress="https://localhost:8731/LTOP/LoadTestingService"/>
          </baseAddresses>
        </host>
      </service>
```

### Under the

<system.servicemodel><behaviors><serviceBehaviors><behaviornam e="CommonBasicHTTPBehavior"> tag, change the httpGetEnabled parameter to false, and the httpsGetEnabled parameter to true.

#### Example before:

<serviceMetadata httpGetEnabled="true" httpsGetEnabled="false" />

### Example after:

<serviceMetadata httpGetEnabled="false" httpsGetEnabled="true" />

d. To replace LTOPSvc.exe.config with the predefined LTOPSvc.exe.configfor\_ssl file, copy LTOPSvc.exe.config-for\_ssl from the <installdir>\conf\httpsconfigfiles directory and place it under the <installdir>\bin\LTOPbin directory.

Rename LTOPSvc.exe.config-for\_ssl to LTOPSvc.exe.config.

3. Restart the Windows service "LoadRunner Load Testing Service".

**Note:** If the "LoadRunner Load Testing Service" does not start after configuring the LoadRunner Enterprise host to listen on HTTPS, see Software Self-solve knowledge base article KM03101264.

4. Run the following command:

<installdir>\bin\lr\_agent\_settings.exe -check\_client\_cert 1 -restart\_agent

5. After you finish configuring the LoadRunner Enterprise host to support TLS/SSL, reconfigure any hosts that are part of the environment.

# Configure LoadRunner components to work with TLS/SSL

You must update CA and TLS certificates if they were created with LoadRunner tools (Controller, MI Listener, Load Generators, Monitors Over Firewall) or they do not contain the required extension information for the CA certificate being used.

You also need to update CA and TLS certificates for the LoadRunner Enterprise server which communicates with load generators for LAB-related operations. Make sure the certificate files within the **<LRE\_server\_installdir>\dat\cert** folder have the exact names of **cert.cer** and **verify\cacert.cer**, no matter if they are the default ones provided as part of the installation, or if they are your company certificates.

For details on how to obtain the required certificates, see Secure Communication with TLS (SSL) in the LoadRunner Professional Help Center.

- **Note:** After configuring secure communication with TLS, you need to restart the services. To do this, you can either:
- Run LoadRunner Agent Service and LoadRunner Remote Management Agent Service.
- Alternatively, run the following command:

lr\_agent\_settings.exe -restart\_agent

## Configure load generators to work with TLS/SSL

This section describes how to configure TLS (SSL) communication to the load generators. It describes how to create and install a Certification Authority and a Client Certificate for working with TLS to secure communication to your load generators. It also describes how to enable TLS from LoadRunner Enterprise Administration.

### Create and copy digital certificates

1. Create a Certification Authority (CA)

**Note:** This step describes how to create a CA using the **gen\_ca\_cert.exe** utility. If you are working on a Linux platform, use the **gen\_ca\_cert** utility instead.

On one of your LoadRunner Enterprise hosts, run the **gen\_ca\_cert** command from the **<LRE\_host\_installdir>\bin** with at least one of the following options:

- -country\_name
- -organization name
- -common\_name

This process creates two files in the folder from which the utility was run: the CA Certificate (**cacert.cer**), and the CA Private Key (**capvk.cer**).

**Note:** By default, the CA is valid for three years from when it is generated. To change the validation dates, use the **-nb\_time** 

(beginning of validity) and/or -na\_time (end of validity) options.

The following example creates two files: **ca\_igloo\_cert.cer** and **ca\_igloo\_ pk.cer** in the current folder:

```
gen_ca_cert - country_name "North Pole" -organization_name "Igloo Makers" -common_
name "ICL" -CA_cert_file_name "ca_igloo_cert.cer" - CA_pk_file_name "ca_igloo_
pk.cer" -nb_time 10/10/2013 -na_time 11/11/2013
```

2. Install Certification Authority (CA)

You need to install the CA on the hosts that you want to enable TLS communication including Controllers, LoadRunner Enterprise servers, Load Generators, and MI Listeners.

Run the **gen\_ca\_cert** utility from the **<LRE\_host\_installdir>\bin** folder with one of the following parameters:

- -install <name/path of the CA certificate file>. Replaces any previous CA list and creates a new one that includes this CA only.
- -install\_add <name/path of the CA certificate file>. Adds the new CA to the existing CA list.

### Note:

- The -install and -install\_add options install the certificate file only. Keep the private key file in a safe place and use it only for issuing certificates.
- If your load generator is over firewall, install the CA on the MI Listener machine.

### 3. Create a Client Certificate

**Note:** This step describes how to create a client certificate using the **gen\_cert.exe** utility. If you are working on a Linux platform, use the **gen\_cert** utility instead.

On one of your LoadRunner Enterprise hosts, run the **gen\_cert** command from the **<LRE\_host\_installdir>\bin** folder with at least one of the following options:

- -country\_name
- -organization\_name
- organization\_unit\_name
- ° -eMail
- -common\_name

It is important to note the following:

- The CA Certificate and the CA Private Key files are necessary for the creation of the certificate. By default, it is assumed that they are in the current folder, and are named cacert.cer and capvk.cer respectively. In any other case, use the -CA\_cert\_file\_name and -CA\_pk\_file\_name options to give the correct locations.
- The certificate file is created in the folder from which the utility was run. By default, the file name is **cert.cer**.
- 4. Install a Client Certificate

You need to install the client certificate on the hosts that you want to enable TLS including LoadRunner Enterprise hosts (used as Controllers), LoadRunner Enterprise servers, Load Generators, and MI Listeners.

Run the **gen\_cert** utility from the **<LRE\_host\_installdir>\bin** folder with the following parameter:

-install <name/path of the client certificate file>

### Note:

- Steps 3 and 4 describe how to install the same client certificate. Alternatively, you can create a new client certificate on each machine.
- Make sure the certificate files within the <LRE\_installdir>\dat\cert folder have the exact names of cert.cer and verify\cacert.cer, no

matter if they are the default ones provided as part of the installation, or if they are your company certificates.

5. Restart the agent configuration

On the load generator machines, open LoadRunner Enterprise Agent Configuration and click **OK** to restart the agent configuration. On the MI Listener machines, open Agent Configuration and click **OK** to restart the agent configuration.

### Enable TLS communication for load generators

- 1. Log onto LoadRunner Enterprise Administration. For details, see "Log on to LoadRunner Enterprise Administration" on page 134.
- 2. On the LoadRunner Enterprise Administration sidebar, under **Maintenance** select **Hosts**.
- 3. Under the **Host Name** column, click the name of an existing host or load generator over a firewall host.

Alternatively, click **Add Host** 🕀 to create a new host.

4. In the Host Details or New Host page, select **Enable SSL**.

## Working with the LoadRunner Enterprise Agent

The LoadRunner Enterprise Agent runs on the load generators and enables communication between the Controller, Load Generators, and MI Listeners (in over firewall configurations). The agent receives instructions from the Controller to initialize, run, pause, and stop Vusers. At the same time, the agent also relays data on the status of the Vusers back to the Controller.

### Run the LRE Agent as a process

In some cases, running GUI Vusers on remote machines, or terminal sessions, the LoadRunner Enterprise Agent must run as a process.

## To change the LoadRunner Enterprise Agent from a service to a process:

On the host machine, select LoadRunner > Tools > Agent Runtime Settings Configuration from the Start menu, and select Manual log in to this machine.

### Run the LRE Agent as a service

In most cases, the LoadRunner Enterprise Agent runs as a service.

## To change the LoadRunner Enterprise Agent from a process to a service:

- On the host machine, select LoadRunner > Tools > Agent Runtime Settings Configuration from the Start menu.
- 2. Select **Allow virtual users to run on this machine without user login**, and enter a valid user name and password.

### Configure the LRE Agent on load generator machines

When working with protocols that use network files or Web protocol Vusers that access the Internet through a proxy server, the Load Generator agent must have network permissions. Note that the default user created by LoadRunner Enterprise, **System**, does not have network permissions.

By default, the LoadRunner Enterprise Agent runs as a service on the Load Generator machines. You can either run the agent as a process or you can continue running the agent as a service. To continue running it as a service, configure it to run the session using the local system account or another user account with network access permissions.

## Map network drives when running the LRE Agent as service

For all Windows platforms, when the user is logged off, the service cannot resolve the mapping of network drives. In cases when the service cannot work with mapped network drives, use the full path to the directory, for example, <\\<machine-name>\<directory>\>.

## LoadRunner Remote Management Agent

The LoadRunner Remote Management Agent Service enables you to manage remote machines from LoadRunner Enterprise Administration.

The agent is hosted on a Windows-based operating system, and is run as a service under a Local System account which has extensive permissions.

**Note:** We recommend changing the Local System account to run the service with the minimal permissions required for its operation (see below for details).

### Change user under which the services are running

To run the agent service with a less-privileged user, change the user under which the service is running. To do this, configure a limited user account with restricted permissions (such as a Windows service account), that allows the user to perform only the necessary actions required by the system.

When creating a limited user account for running the agent service, we recommend using a Standalone Load Generator. Otherwise you must reconfigure the service to run under this user account each time the LoadRunner Enterprise server or host are reconfigured. This is because the process recreates the LoadRunner Remote Management Agent Service with the default Local System account permissions.

**Note:** Remote restarting of hosts and running remote installations is not supported when the Remote Management Agent service is running under a non-admin user account.

## **Configure Linux load generators**

You can increase the number of file descriptors, process entries, and amount of swap space by configuring the kernel.

For details and recommendations on improving Linux Load Generator performance, see the *LoadRunner Professional Installation Guide* available from the LoadRunner Professional Help Center.

## Change load generator TEMP folder

This section describes how to manually change the default TEMP folder used by the load generator to store data during a test run. The TEMP folder is predefined, and is based on the load generator installation folder.

### Why change the location of the folder?

- The TEMP folder also contains the script. Depending on the machine and the script, this path can get long, and exceed the character limitation set by Windows.
- You want to use a different folder or drive instead of the default one.

**Note:** You cannot change the TEMP folder location if your load generator is configured over a firewall, regardless of whether the firewall is enabled or not.

### Before changing the TEMP folder

Note the following before changing the TEMP folder used by the load generator:

- The change is made on the LoadRunner Enterprise Host that is serving as a Controller. Therefore, such change applies only to the load generators using this Controller.
- If you are using the same load generators with a new Controller, you need to reapply this change on the new Controller.

### To change the TEMP folder:

- 1. Log onto the LoadRunner Enterprise Host machine.
- 2. Verify that the **WIrun.exe** process is down.
- 3. Open **<LG installation folder>\config\WIrun7.ini** in a text editor.
- Add the line "UserRemoteTmpDir=<Custom temp location>" under the '[Host]' section
- 5. Save the change.

## Download standalone applications

This section explains the steps necessary to enable you to download standalone applications from the Download Applications window.

### To enable downloading standalone applications:

1. Go to the **<LRE\_server\_installdir>\Additional Components** folder. This directory contains the applications' execution (**.exe**) files.

**Note:** The necessary **.exe** files for downloading VuGen, Analysis, Standalone Load Generator, Monitor over Firewall, and MI Listener, are located in the **Applications** directory, which is contained within the **Additional Components** directory.

- 2. On the LoadRunner Enterprise server, go to the **Downloads** directory, which is located in **<LRE\_server\_installdir>\PCWEB\Downloads**.
- To enable downloading an application, copy the relevant execution file (.exe) from the <LRE\_server\_installdir>\Additional Components folder to the Downloads directory on the LoadRunner Enterprise server.

**Note:** You may need to refresh the Download Applications window for the changes to take effect.

## Customize the download applications window

You can edit and customize the appearance of the download applications window. To customize the window, edit the **downloads.xml** file located in the **Downloads** directory on the LoadRunner Enterprise server.

The following tags in the **downloads** file control the following features on the window. Edit the tags as desired to change the appearance of the window.

- App Name. The name of the application.
- Image. Whether the application's icon is displayed.

- **File Name.** If you changed the name of the application's execution file, you must update this section so that it matches the new name of the execution file.
- **Description.** The application's description.

### To customize the download applications window:

- 1. (Recommended) Make a backup copy of the **downloads.xml** file before customizing the appearance of the download applications window.
- 2. Open the **downloads.xml** file, and update the tags as required.

For example:

```
<app name="MyNewApp" image="assets/images/download-
applications/my_Icon.svg">
    <file name="my_file_name.exe">
    <description>My file description...</description>
    </file>
    </app>
```

**Note:** The download applications window supports a multilingual user interface for the default applications only. Any changes to the default application tags, and new applications that are added to the **downloads.xml** file, are not supported by MLU.

## **Enable MS-SQL Windows authentication**

This section describes how to configure an MS-SQL database with Windows authentication.

**Note:** The procedure below requires you to make changes to the MS-SQL database. We recommend that you make these changes using the SQL Server Management Studio tool.

### To enable Windows authentication:

1. Verify that the LoadRunner Enterprise server and database server all belong to the same domain, and that there is a domain user with administrator

permissions common to all the machines.

- 2. Change users to domain users using the System Identity Utility. For details, see Change the LoadRunner Enterprise system user in the LoadRunner Enterprise Help Center.
- 3. Download the SQL Server Management Studio tool from the Microsoft Download Center.
- 4. In SQL Server Management Studio, perform the following actions:
  - a. In the Object Explorer pane, expand the **Security** folder.
  - b. Right-click Logins and select New Login.
  - c. Enter the domain user in the **Login name** box, and make sure that **Windows Authentication** is selected.

**Note:** Verify that the domain user is assigned the same **Server Roles** as the database administrative user **(td\_db\_admin)**.

5. Make sure that the relevant project is created in LoadRunner Enterprise Administration with the **MS-SQL (Win Auth)** database type. For details, see the LoadRunner Enterprise Help Center.

## Post-installation configuration steps

After running the LoadRunner Enterprise installation and Configuration wizard, you must perform additional configuration steps in LoadRunner Enterprise Administration before you can use the product.

This section includes:

- "Configure LRE servers and hosts post-installation" on the next page
- "Log on to LoadRunner Enterprise Administration" on the next page
- "Perform site and lab administration tasks" on page 135
- "Change the database administrator and user passwords" on page 137
- "Change passwords using REST APIs" on page 138

## Configure LRE servers and hosts postinstallation

**Note:** You can skip these steps if you configured LoadRunner Enterprise servers and hosts during the installation process.

While you can configure LoadRunner Enterprise servers and hosts during the installation process, you can also configure them post-installation from the Configuration wizard in the Start menu. To do this, you must run the wizard as an administrator.

1. Prerequisites

Install LoadRunner Enterprise. For details, see "Install and configure LRE servers and hosts" on page 48.

2. Launch the Server Configuration Wizard or Host Configuration Wizard from the Start menu using the Run as administrator option.

For details, see "Configure LRE servers and hosts" on page 53.

## Log on to LoadRunner Enterprise Administration

LoadRunner Enterprise administration tasks are performed in LoadRunner Enterprise Administration.

### To log in to LoadRunner Enterprise Administration:

1. Open your Web browser (Chrome, Edge, Firefox and Safari are supported) and type the LoadRunner Enterprise Administration URL in the following format:

http://<LoadRunner\_Enterprise\_Server\_name>/admin

The LoadRunner Enterprise Administration Login window opens.

 In the User Name box, type your user name. Only a Site or Tenant Admin user can log on to LoadRunner Enterprise Administration. For details, see Administrator user types in the LoadRunner Enterprise Help Center. **Note:** The first time you log in to LoadRunner Enterprise Administration, you must use the site administrator name that you specified during the installation of LoadRunner Enterprise (see page 60). After you log in to LoadRunner Enterprise Administration, you can define additional site administrators. For details, see Define a LoadRunner Enterprise site administrator in the LoadRunner Enterprise Help Center.

3. In the **Password** box, type the site administrator password.

If you are logging in using your internal LoadRunner Enterprise password, you can reset the password by clicking **Forgot or want to change password** (not available when using LDAP or SSO authentication).

- 4. Select the language for displaying the LoadRunner Enterprise user interface. The multilingual user interface, or MLU, provides support for multiple languages on a single instance of LoadRunner Enterprise without having to install language packs. Supported languages are English, French, Italian, Korean, German, Japanese, Simplified Chinese, and Spanish.
- 5. Click the **Login** button. LoadRunner Enterprise Administration opens.

## Perform site and lab administration tasks

After installing LoadRunner Enterprise servers and hosts, you perform the site and lab administration tasks from LoadRunner Enterprise Administration.

1. Log on to LoadRunner Enterprise Administration.

For details, see "Log on to LoadRunner Enterprise Administration" on the previous page.

2. Perform site configuration tasks.

Configure the authentication method which allows users to log in to LoadRunner Enterprise, and define the project file repository.

For details, see Select authentication type and Project repository in the LoadRunner Enterprise Help Center.

3. Create and maintain projects.

You can create and maintain projects, and define the limits and other settings for the project from **Management > Projects**.

For details, see Manage projects in the LoadRunner Enterprise Help Center.

4. Create and manage users and user roles.

You can create users and control access to a project by defining the users who can log in to the project, and by specifying the types of tasks (roles) each user may perform from **Management > Users**.

For details, see Manage users in a project and Assign roles and permissions in the LoadRunner Enterprise Help Center.

5. Add or reconfigure LoadRunner Enterprise hosts.

To work with hosts, you must first add them to LoadRunner Enterprise Administration and define the host's location. If the host is a load generator over a firewall, you must define the MI Listener through which the load generator communicates with the LoadRunner Enterprise server.

When adding hosts, the system configures the LoadRunner Enterprise user on that machine. For details, see Add a host in the LoadRunner Enterprise Help Center.

**Note:** If you upgrade LoadRunner Enterprise from an earlier version or migrate an existing LAB\_PROJECT from ALM (direct migration is supported up to LoadRunner Enterprise 2023), the hosts become unavailable and you must reconfigure them as follows:

- a. Install the latest LoadRunner Enterprise version (see "Upgrade LoadRunner Enterprise" on page 48).
- b. In LoadRunner Enterprise Administration, select **Management > Hosts**.
- c. Select the hosts you want to reconfigure in the Hosts grid, and click **Reconfigure Host**.
- 6. Run a system health check.

After adding a LoadRunner Enterprise server to the system, and adding or reconfiguring LoadRunner Enterprise hosts, you should perform a system health check to make sure all components are running as expected.

For details, see Perform a system health check in the LoadRunner Enterprise Help Center.

7. Set the license keys.

To run tests from LoadRunner Enterprise, you must install the appropriate LoadRunner Enterprise server and host licenses.

For details, see Manage licenses in the LoadRunner Enterprise Help Center.

# Change the database administrator and user passwords

You can change the database administrator and user passwords that you configured for the LoadRunner Enterprise server from the Database Passwords Changer utility in the Start menu.

**Note:** You can use a REST command to change the database user password in the Database Password Changer utility without having to use the user interface. For details, see "Update database user passwords" on page 141.

- 1. Stop the LoadRunner Backend Service.
- 2. Change the database administrator and/or user passwords (according to the required change) on the database server.
- 3. Run the Database Passwords Changer utility from the **Start** menu, and enter the new password for the LoadRunner Enterprise database administrator and/or user.

**Note for Oracle databases only:** Changing the username password affects only the LRE\_SITE\_MANAGEMENT\_DB and LRE\_SITE\_ADMIN\_DB user's password.

For more details on DB Administrator and User credentials, see the "Configure the connection to the LoadRunner Enterprise database server." on page 55

4. On successful completion of the utility, restart the LoadRunner Backend Service.

## **Change passwords using REST APIs**

You can use REST APIs to update passwords in LoadRunner Enterprise configuration tools and components. This enables you to rotate passwords more easily, with minimal user intervention.

Tool / Component	Action
Identity Changer utility	Silently run the System Identity Changer utility to reconfigure the password of the LoadRunner Enterprise system user. For details, see "Update the system user password" on the next page.
Database Password Changer	Update database user passwords in the Database Password Changer utility. For details, see "Update database user passwords" on page 141.
SMTP page in LRE Administration	Update the password for the user specified to connect to the SMTP mail server in the SMTP server tab of LoadRunner Enterprise Administration. For details, see "Update the SMTP user password" on page 142.

REST commands can be used in the following tools and components:

### Run the Configuration Service application

To use REST commands to perform these actions, the **ConfigurationService** application must be running.

- You can run the application using a service named LoadRunner Configuration Service, or by launching LRE.Tools.ConfigurationService.exe with "--console" as the argument.
  - In Powershell, run the command:

.\LRE.Tools.ConfigurationService.exe --console

• In a command prompt window, run the command:

LRE.Tools.ConfigurationService.exe --console

- Change to <LRE\_server\_installdir>\LRE\_CONFIGURATION\_ SERVICE\directory) located under <LRE\_server\_installdir>\LRE\_ CONFIGURATION\_SERVICE\.
- 3. You can change the port listened by the application under localhost in the **appsettings.json** file. For security reasons, the application has been limited to be accessible through localhost only.
- 4. After launching the ConfigurationService application, you can access a Swagger page that displays all the available REST commands exposed by the application and how to use them.

To open the Swagger page, type the following in a web browser:

http://localhost:5000/swagger/index.html

**Note:** This page only opens if the application is running.

5. After running the Configuration Service Tool REST APIs, we recommend restarting the LoadRunner Backend Service for the password changes to take effect.

### Update the system user password

You can use a REST command to silently run the System Identity Changer utility to reconfigure the password of the LoadRunner Enterprise system user without having to use the user interface.

You can also use a REST commend to have the System Identity Changer utility provide an update of the reconfiguration status of the LoadRunner Enterprise server and hosts in a .CSV file.

To update the s	ystem user	password:
-----------------	------------	-----------

Prerequisites	Make sure the <b>ConfigurationService</b> application is running. For details, see "Run the Configuration Service application" on the previous page.
Request URL	<pre>POST http://localhost:5000/CredentialsUpdater/update- password-of-lre-account</pre>

Payload	<ol> <li>In the "siteAuthenticate" property, enter the authentication credentials of the Site Management user (not the user account in the OS platform).</li> </ol>
	<ol> <li>In the "newPassword" property, enter the new password to be set for the system account used by LoadRunner Enterprise.</li> </ol>
	{
	"siteAuthenticate": {
	"username": "string",
	"password": "string"
	},
	"newPassword": "string"
	}
Deemense	
Response	A .csv file that can be queried for progress in the next command.

### To get an Identity Changer progress report:

After running the command to update the password, you can get a progress report on Identity Changer reconfiguration.

RequestPOST http://localhost:5000/CredentialsUpdater/get-<br/>progress-report

# Payload1. In the "siteAuthenticate" property, enter the authentication<br/>credentials of the Site Management user (not the user account in<br/>the OS platform).

2. In the "journalName" property, enter the response provided from the update system user password command.

```
{
  "siteAuthenticate": {
  "username": "string",
  "password": "string"
 },
  "journalName": "string"
}
```

### Update database user passwords

You can use a REST command to reconfigure the password of LoadRunner Enterprise database users in the Database Password Changer utility without having to use the user interface.

### To update the database passwords:

Prerequisites	Make sure the <b>ConfigurationService</b> application is running. For details, see "Run the Configuration Service application" on page 138.
Request URL	<pre>POST http://localhost:5000/CredentialsUpdater/update- database-passwords</pre>

Installation Guide Installation and configuration

Payload 1 2	<ol> <li>In the "systemIdentity" property, enter the same system account used to run LoadRunner Enterprise.</li> <li>In the "databasePasswords" property, enter the new database passwords.</li> </ol>
	<pre>{     "systemIdentity": {         "domain": "string".</pre>
	"userName". "string"
	"naceword": "ctning"
	passworu : string
	},
	"databasePasswords": {
	"strongUserNewPassword": "string",
	"newDefaultPassword": "string"
	}
	}
	3. After running the Configuration Service tool REST API, we recommend restarting the LoadRunner Backend Service for
	the password changes to take effect.
Response	The answer will be true or false with a reason message.

### Update the SMTP user password

You can use a REST API call to update the SMTP user password in LoadRunner

Enterprise Administration without having to use the user interface.

## **Prerequisites** Make sure the **ConfigurationService** application is running. For details, see "Run the Configuration Service application" on page 138.

Request URL	<pre>POST http://localhost:5000/CredentialsUpdater/set- smtp-configuration</pre>
	<b>Note:</b> If multiple tenants are defined in your environment, you must specify the tenant in the URL as a parameter.
	<b>Example:</b> If you have a tenant guid a128c06-5436-413d-9cfa- 9f04bb738df3 (this is the default tenant, but you can specify any other one in your environment), the URL looks like this:
	http://localhost:5000/CredentialsUpdater/set-smtp- configuration?tenant=fa128c06-5436-413d-9cfa- 9f04bb738df3

# Payload1. In the "adminAuthenticate" property, enter the<br/>authentication credentials to the LoadRunner Enterprise<br/>Administration page of the LoadRunner Enterprise server or<br/>the tenant.

2. In the "newPassword" property, enter the new password to be used in SMTP. The tenant looks like this:

```
{
    "adminAuthenticate": {
        "username": "string",
        "password": "string",
        "accessKey": {
            "clientIdKey": "string",
            "clientSecretKey": "string"
        }
    },
    "newPassword": "string"
}
```

### Not using SSO authentication

If you are not using SSO authentication, your payload should either contain:

• Credentials of a user with access to the Administration page of the LoadRunner Enterprise server:

```
{
    "adminAuthenticate": {
        "username": "string",
        "password": "string"
    },
    "newPassword": "string"
}
```

• An access token of an administration user (see the example for SSO authentication below).

**Using SSO authentication**
If you are using SSO authentication, you must create an access token and then use a payload like this:

### Notes for changing passwords using REST APIs

The following notes apply when changing passwords using REST APIs:

- The ConfigurationService application must be part of the LoadRunner Enterprise server; it cannot be used on its own or as a standalone application.
- You can run the update database passwords command while the LoadRunner Enterprise server is down. The other commands, update system user and SMTP user, will not work without LoadRunner Enterprise being up and running.
- In the response of all commands, there is an option to provide an error as a response instead of expected response which indicates a failure.

# Working with firewalls

# Using firewalls

You can set up your LoadRunner Enterprise system to run Vusers and monitor servers over a firewall.

This chapter includes:

About using firewalls	
Over firewall deployment - example	
• Set up the system to use firewalls - workflow	
Install over firewall components	
Initial configuration of over firewall system	
Specify MI Listeners	

# About using firewalls

Working with a firewall means that you can prevent unauthorized access to or from a private network, on specific port numbers.

For example, you can specify that no access is allowed to any port from the outside world, with the exception of the mail port (25), or you can specify that no outside connection is allowed from any ports to the outside except from the mail port and WEB port (80). The port settings are configured by the system administrator.

In a typical performance test (not over a firewall), the Controller has direct access to the LoadRunner Enterprise agents running on remote machines. This enables the Controller to connect directly to those machines.

When running Vusers or monitoring applications over a firewall, this direct connection is blocked by the firewall. The connection cannot be established by the Controller, because it does not have permissions to open the firewall.

LoadRunner Enterprise solves this problem by using secure TCP over proxy. This communication is secure by using TLS (formerly SSL). For details on

communication over proxy, see "Set up your deployment (TCP or TCP over proxy)" on page 154.

LoadRunner Enterprise agent is already installed on load generators (running Vusers over a firewall), and on Monitor Over Firewall machines (that monitor the servers that are located over a firewall). The agent communicates with the MI Listener machine on port 443.

The MI Listener is a component that serves as router between the Controller and the LoadRunner Enterprise agent.

When the LoadRunner Enterprise agent connects to the MI Listener, the MI Listener keeps a listing of the connection to the agent using a symbolic name that the agent passed to it.

When the Controller connects to the MI Listener, it communicates to the MI Listener on port 50500.

The Controller uses a symbolic name for the agent, and provides the MI Listener machine's name. If there has been a connection from the agent with the same symbolic name to this MI Listener, the connection is made between the Controller and the agent. After you have a connection with the agent, you can run Vusers

## **Over firewall deployment - example**

The following diagram is a basic example of a LoadRunner Enterprise deployment over a firewall.

As explained in the previous section, the LoadRunner Enterprise agent is installed on both the load generator machine and the Monitor Over Firewall machine. During installation, the LoadRunner Enterprise agent is added as a Windows service.

The MI Listener serves as a router between:

• The agent on the load generator machine and the Controller, enabling the Controller to run Vusers over a firewall.

• The agent on the Monitor Over Firewall machine and the Controller, enabling the Controller to monitor the servers that are located over a firewall.

## Set up the system to use firewalls - workflow

Setting up the system to use firewalls involves the following stages of configuration:

Stage	Description
Installation and initial configuration	Install the necessary components and perform initial configuration settings. For details, see "Install over firewall components" on page 153, and "Initial configuration of over firewall system" on page 153.
Enabling running Vusers over a firewall	When there is a firewall between the Controller and load generator host machines, set up the system to run Vusers over the firewall. For details, see "Run Vusers over a firewall" on page 160.
Enabling monitoring over a firewall	Set up your system to monitor the application under test (AUT) when there is a firewall between the Controller and the AUT. For details, see "Monitor over a firewall" on page 165.
Checking Connectivity	After installing and configuring all the necessary components, check that you are able to establish a connection between the LoadRunner Enterprise agent, the MI Listener, and the Controller machine. For details, see "Check connectivity" on page 178.

The following flow chart provides a general outline of the steps that you need to perform to set up your system to work with firewalls.

## Install over firewall components

To enable over firewall communication, ensure that you have installed the following LoadRunner Enterprise components:

Component	Description
MI Listener	Serves as a router between the Controller and the LoadRunner Enterprise agent. You install the MI Listener component on a dedicated machine. For installation instructions, see "Install standalone components (Windows)" on page 87.
	For instructions on configuring the MI Listener machine, see "Configure the MI Listener" on page 156.
Monitor Over Firewall component	Used to monitor the servers that are located over a firewall. You install the Monitors over Firewall component on a dedicated machine. For installation instructions, see "Install standalone components (Windows)" on page 87.
	For information about configuring the Monitor Over Firewall machine, see "Monitor over a firewall" on page 165.

# Initial configuration of over firewall system

After you have installed the necessary components, you are ready to configure your over firewall system.

#### To perform initial configuration of your over firewall system:

1. Configure the system according to TCP or TCP over proxy.

See "Set up your deployment (TCP or TCP over proxy)" on the next page.

2. Modify the firewall settings to enable communication between the machines on either side of the firewall.

See "Configure firewall to allow agent access" on page 155.

3. Configure the MI Listener.

See "Configure the MI Listener" on page 156.

## Set up your deployment (TCP or TCP over proxy)

To run Vusers or monitor servers over the firewall, configure your system according to one of the following configurations. Note that these configurations contain a firewall on each LAN. There may also be configurations where there is a firewall for the Over Firewall LAN only.

#### • TCP configuration

The TCP configuration requires every LoadRunner Enterprise agent machine behind the customer's firewall to be allowed to open a port in the firewall for outgoing communication.

#### TCP over proxy configuration

In the TCP over proxy configuration, only one machine (the proxy server) is allowed to open a port in the firewall. Therefore it is necessary to tunnel all outgoing communications through the proxy server. The proxy server must support HTTP tunneling using the CONNECT method.

### Configure firewall to allow agent access

You modify your firewall settings to enable communication between the machines inside the firewall and machines outside the firewall.

#### TCP configuration

The LoadRunner Enterprise agent attempts to establish a connection with the MI Listener using port 443, at intervals specified in the Connection Timeout field in the Agent Configuration dialog box. To enable this connection, allow an outgoing connection on the firewall for port 443. The agent initiate the connection and the MI Listener communicates with the Load Generator through the connection.

#### TCP over proxy configuration

The LoadRunner Enterprise agent attempts to establish a connection with the MI Listener, using the proxy port specified in the Proxy Port field, and at intervals specified in the Connection Timeout field in the Agent Configuration dialog box.

Installation Guide Working with firewalls

When the connection to the proxy server is established, the proxy server connects to the MI Listener. To enable this connection, allow an outgoing connection on the firewall for port 443. The proxy server can then connect to the MI Listener, and the MI Listener can connect back to the agent through the proxy server. From this point on, the agent listens to commands from the MI Listener.

#### Local System account configuration

If you intend to start the LoadRunner Agent Service from the Local System account, you need to grant it permissions. If you do not provide permissions, the monitor graph does not display any data.

To grant it permissions, add a local user on the AUT machine with the same name and password as the local user on Agent machine. Add the AUT local user to the Performance Monitor Users group and restart the Agent process.

### Configure the MI Listener

To enable running Vusers or monitoring over a firewall, you need to install the MI Listener on one or more machines in the same LAN as the Controller outside the firewall. For installation instructions, see, "Install standalone components (Windows)" on page 87.

#### To configure the MI Listener:

- 1. Prerequisites and security recommendations.
  - You must configure the MI Listener to work with TLS/SSL. For details, see "Configure LoadRunner components to work with TLS/SSL" on page 123.
  - We recommend replacing the LoadRunner Agent Service local system user with a different user account that has lower access levels. For example, you can use the built-in LRE\_SERVICE user or create a new LoadRunner user in the Administrators group.
  - Since the PEM file stored on the MI Listener is not encrypted, we recommend limiting the file permissions of the folder in which the file is located to the same user running the LoadRunner Agent Service from above. To do this:

- i. Go to the <LRE\_installdir>\dat directory.
- ii. Right-click the **cert** folder and select **Properties**. In the **Security** tab, add a LoadRunner user with full control permissions.
- iii. Remove any other users including SYSTEM, Administrator, and all groups such as Authenticate Users, Administrators, and Users (only the LoadRunner user should be displayed).

📜 cert Properties					×
General Sharing	Security	Previous Vers	ions C	ustomize

For special permis click Advanced.	sions or ac	lvanced setting	s,	Advanced	ł
		K C	ancel	Ar	inlu

- 2. On the MI Listener server, open port 443 for the incoming traffic.
- Select Start > Administrative Tools > Services, and stop LoadRunner Agent Service.
- 4. Select Start > All Programs > OpenText > LoadRunner > Advanced Settings
   > MI Listener Configuration, or run

<LoadRunner root folder>\launch\_service\bin\MILsnConfig.exe

5. Set each option as described in the following table:

Option	Description
Check Client Certificates	Select <b>True</b> to request that the client send a TLS/SSL certificate when connecting, and to authenticate the certificate. <b>Default value:</b> False
Private Key Password	The password that may be required during the TLS/SSL certificate authentication process.

Click **OK** to save your changes or **Use Defaults** to use the default values.

- Select Start > Administrative Tools > Services. To restart the LoadRunner Agent Service, select Start > All Programs > OpenText > LoadRunner > Advanced Settings > Agent Service.
- Make sure that no Web Servers are running on the MI Listener or Monitor over Firewall machine. These servers use port 443 and do not allow the access required by the listening and monitoring processes.

# **Specify MI Listeners**

In LoadRunner Enterprise Administration, you specify one or more MI Listeners to enable running Vusers or monitoring data over a firewall.

#### To add an MI Listener:

- On the LoadRunner Enterprise Administration sidebar, under Maintenance > Hosts, select MI Listeners.
- In the MI Listeners tab, click the Add MI Listener button. The New MI Listener page opens.

#### 3. Enter the following details:

Field	Description
MI Listener Name	The host name of the MI Listener. <b>Note:</b> If you have two different IP addresses for the same MI Listener (one for internal communication with the Controller and a second for public communication with a Load Generator located over a firewall), enter the <b>internal IP</b> <b>address</b> here. Enter the public IP address in the <b>Public IP</b> field (see below).
Description	A description of the MI Listener.
Public IP	The public IP address of the MI Listener. <b>Note:</b> If you have two different IP addresses for the same MI Listener, one for public communication with a Load Generator located over a firewall and a second for internal communication with the Controller, enter the public IP address here. Enter the <b>internalIP address</b> in the <b>MI Listener</b> <b>Name</b> field (see above).
Purpose	<ul><li>The role designated to the MI Listener:</li><li>Monitoring over a firewall</li><li>Running Vusers over a firewall</li></ul>

4. Click **Save**. The MI Listener is added to the grid.

# Run Vusers over a firewall

You can set up LoadRunner Enterprise to run Vusers over a firewall.

This chapter includes:

•	Run Vusers over a firewall - workflow	.161
•	Configure hosts to run Vusers over a firewall	162

## Run Vusers over a firewall - workflow

**Note:** Before you configure your system to run Vusers over the firewall, ensure that you have completed the configuration steps described in "Initial configuration of over firewall system" on page 153.

#### To run Vusers over a firewall:

- In LoadRunner Enterprise Administration, specify the details of the MI Listener used to run Vusers over the firewall. For details, see "Specify MI Listeners" on page 158.
- 2. Configure the LoadRunner Enterprise agent on each Load Generator machine that runs over a firewall to communicate with the MI Listener.

For information on how to configure the LoadRunner Enterprise agent, see "Configure the LoadRunner Enterprise agent" on page 172.

**Note:** After you configure the LoadRunner Enterprise agent on the Load Generator machine, you can edit the configuration settings from LoadRunner Enterprise Administration. For details, see Manage hosts in the LoadRunner Enterprise Help Center.

 In LoadRunner Enterprise Administration, configure the relevant Load Generator hosts to run over a firewall. For details, see "Configure hosts to run Vusers over a firewall" below.

## Configure hosts to run Vusers over a firewall

To use a LoadRunner Enterprise host to run Vusers over a firewall, you need to configure the relevant hosts as Load Generators in LoadRunner Enterprise Administration.

Part of the process of configuring a LoadRunner Enterprise host involves selecting a location for your host. For example, locations can be defined according to physical areas. The location also determines whether the host is located over a firewall.

Before you configure the host, you need to ensure that you have added a location over a firewall. When you are configuring a host to operate over a firewall, you select a location that is located over a firewall.

This section describes the basic steps of how to add a host as a Load Generator for running Vusers over a firewall. For detailed information about adding hosts in LoadRunner Enterprise, refer to the LoadRunner Enterprise Administration Guide.

#### To configure a host to run Vusers over a firewall:

- 1. Add the location that is over a firewall.
  - a. In LoadRunner Enterprise Administration, select **Maintenance > Hosts** and click the **Locations** tab.
  - b. Click **Add** 🕀 . The New Location dialog box opens.
  - c. Enter the following details:

Location Name	The name of the host location. The name must have a logical connection to the host location.
Description	A description of the host location.
Over Firewall	Indicates whether the host location is over a firewall.

- 2. Add the over firewall host.
  - a. On the LoadRunner Enterprise Administration sidebar, select **Maintenance > Hosts**.
  - b. Select the Hosts tab, and then click Add Host  $\oplus$ .
  - c. In the New Host dialog box, enter the following details:

Host Name	The fully qualified domain name or IP address of the host that is assigned when creating the host.
Description	A description of the host.
Purpose	Select a purpose for the host. Note that a host over a firewall can only have a Load Generator purpose.
Source	Select the host's source: <b>Local</b> if the host exists in your testing lab, or <b>Cloud</b> if the host was provisioned from a cloud provider.
Priority	A rank assigned to the host. Assigning a higher priority to a host increases the likelihood of the host being allocated to a test. There are a number of criteria to consider when assigning priority. The main considerations are whether the host is a dedicated machine or a shared resource, and the type of hardware installed on the machine.
Status	Indicate the status of the host.
Location	The location of the host that is over the firewall.
Installation	Select the installation type of the host. For a standalone installation of the Load Generator, select <b>OneLG</b> .
MI Listener	Enter the IP address or host name of the MI Listener that enables data collection.

Enable SSL	Indicates whether the Load Generator is to communicate with the Controller using TLS (formerly SSL) or not. This option is available when the load generator is located over a firewall.
	<b>Note:</b> The load generator uses TLS to communicate with the Controller during runtime only. For non runtime functionality (including collating results), the Load Generator does not use TLS as the communication protocol.
Belongs to Pools	The host pools to which the host is assigned. Host pools enable you to control which hosts are allocated to which projects.
Host Attributes	Attributes of the host. <b>Example:</b> Memory, strength, installed components

# Monitor over a firewall

You can set up LoadRunner Enterprise to monitor servers over a firewall.

This chapter includes:

•	Monitor over a firewall - workflow	166
•	Configure monitor settings	.167
•	Configure the project to receive monitor over firewall information	.170
•	Edit monitor over firewall machines during a test run	.170

**Note:** Before you configure your system to monitor servers over a firewall, ensure that you have completed the configuration steps described in "Initial configuration of over firewall system" on page 153.

#### To set up your system to monitor servers over a firewall:

- In LoadRunner Enterprise Administration, specify the details of the MI Listener used to monitor servers over the firewall. For details, see "Specify MI Listeners" on page 158.
- 2. Configure the LoadRunner Enterprise agent on each Monitor Over Firewall machine to communicate with the MI Listener.

For details, see "Configure the LoadRunner Enterprise agent" on page 172.

3. Use the Monitor Configuration tool to configure the servers to monitor and define specific measurements that LoadRunner Enterprise collects for each monitored server.

For details, see "Configure monitor settings" below.

4. In the relevant project, establish a connection between the tests you are running and the Monitor Over Firewall machines.

For details, see "Configure the project to receive monitor over firewall information" on page 170.

## **Configure monitor settings**

You configure the monitor settings from the Monitor Over Firewall machine, using the Monitor Configuration tool. You select the type of monitors to run and the server whose resources you want to monitor, add the measurements to monitor for each server, and specify the frequency at which the monitored measurements are to be reported.

#### To configure monitor settings:

- On the Monitor Over Firewall machine, select LoadRunner > Advanced Settings > Monitor Configuration from the Start menu. For machines without the complete LoadRunner Enterprise installation, select Server Monitor > Monitor Configuration from the Start menu. The Monitor Configuration dialog box opens.
- 2. Click the **Add Server** button . The New Monitored Server Properties dialog box opens.
- 3. In the **Monitored Server** box, enter the name or IP address of the server whose resources you want to monitor.

**Note:** To add several servers simultaneously, you can specify IP ranges, or separate the server names or IP ranges with commas. For example, 255.255.255.0-255.255.255.5, or server1, server2.

- 4. From the **Available Monitors** list, select the monitors suitable for the server being monitored.
- 5. Click **OK** to close the New Monitored Server Properties dialog box. The Monitored Servers list is displayed in the Monitor Configuration dialog box. Default measurements are displayed for some of the monitors in the Measurements to be Monitored section. You can specify the frequency at which to report the measurements in the Measurement Properties section.
- 6. To add additional monitored servers to the list, repeat the steps above.
- 7. To edit the monitor configuration properties for a server, click the **Edit** button. The Monitored Server Properties dialog box opens enabling you to edit the monitors for the server whose resources you are monitoring.
- 8. Click **Apply** to save your settings.

#### Clone a monitored server's properties

To monitor the same properties on different server machines, you can clone a selected server's properties using the Clone Monitored Server Properties dialog box.

#### To clone a monitored server's properties:

- 1. Open the Monitor Configuration dialog box.
- 2. Right-click the server you want to clone, and select **Clone**. The Clone Monitored Server Properties dialog box opens.
- 3. In the **Monitored Server** box, enter the name or IP address of the cloned server you want to create.

**Tip:** To create several cloned servers simultaneously, you can specify IP ranges, or separate the server names or IP ranges with commas. For example, 255.255.255.0-255.255.255.5, or server1, server2.

4. The **Available Monitors** list displays the monitors that were selected for the server being cloned. Select additional suitable monitors for the cloned server.

- 5. Click **OK** to close the Clone Monitored Server Properties dialog box. The cloned server is displayed in the Monitored Servers list.
- 6. Click **Apply** to save your settings.

#### Add and remove measurements

After you configure one or more server machines to monitor, you add measurements to monitor for each server. If LoadRunner Enterprise added default measurements, you can edit them as required.

#### To add a measurement to monitor:

- 1. Open the Monitor Configuration dialog box.
- 2. Select a server from the Monitored Servers list.
- Click the Add Measurement button. Select the appropriate monitor. A dialog box opens, enabling you to choose measurements for the monitor you selected.
- 4. Select the measurements that you want to monitor, and click **OK**.
- 5. Click **Apply** to save your settings.

#### To remove a measurement from the measurements list:

- 1. Select the measurement, and click the **Delete** button .
- 2. Click **Apply** to save your settings.

#### Configure measurement frequency

After you have configured monitor measurements, you set a schedule for reporting each measurement.

#### To configure measurement frequency:

- 1. In the Monitor Configuration dialog box, under the **Measurement Properties** section, select the configured server measurement you want to schedule.
- 2. Specify the frequency at which you want LoadRunner Enterprise to report the

measurement.

3. Click **Apply** to save your settings.

# Configure the project to receive monitor over firewall information

After you configure the monitors, you configure the project to receive Monitor Over Firewall information during performance test runs.

**Note:** The steps in the section are described in more detail in the section about monitor profiles in the LoadRunner Enterprise User Guide.

# To configure the project to receive Monitor Over Firewall information:

- 1. Add a monitor over firewall which can be accessed by performance tests in this project.
  - a. In the top banner, click the module name or the dropdown arrow and select
     Monitors (under Assets).
  - b. Click 🔄 New Monitor Over Firewall.
  - c. Enter a name, the machine key, and select the MI Listener with which the monitor is to connect.
- 2. Select the Monitor Over Firewall agent to use in a specific performance test.
  - a. In the Test Plan module, select a performance test, and click **Edit Test** to open the test in the Performance Test Designer window.
  - b. In the Monitors tab, select the Monitor Over Firewall agent.

# Edit monitor over firewall machines during a test run

While a performance test is running, you can change the status of a Monitor Over Firewall agent or add another monitor to the test.

#### To modify the Monitor Over Firewall machines:

- On the Test Run page, click the Monitors button 2 and select Monitors
   Over Firewall. The Monitors Over Firewall dialog box opens.
- 2. You can view the Monitor Over Firewall agents that are monitoring the test, as well as their connection status.
  - To connect or disconnect a Monitor Over Firewall agent, click the **Connect/Disconnect** button.
  - To add a Monitor Over Firewall agent to the test, select it from the Add Monitor Over Firewall list.

# Configure the LoadRunner Enterprise agent

You can set up your LoadRunner Enterprise system to run Vusers and monitor servers over a firewall. As part of the process of setting up your LoadRunner Enterprise system to work over firewalls, you configure the LoadRunner Enterprise agent.

This chapter includes:

•	Configure agents over the firewall - workflow	.173
•	Configure the agent on Windows	173
•	Configure the agent on Linux	175
•	Agent configuration settings	.176
•	Check connectivity	178

## Configure agents over the firewall - workflow

For LoadRunner Enterprise to work over firewalls, you need to configure the LoadRunner Enterprise agent on each Load Generator machine running over a firewall, and on each Monitor Over Firewall machine.

You configure the LoadRunner Enterprise agent to communicate with the MI Listener. The MI Listener serves as a router between the LoadRunner Enterprise agent and the Controller.

# Configure the agent on Windows

This section describes how to configure the LoadRunner Enterprise Agent on Windows machines to communicate with the MI Listener.

# To configure the LoadRunner Enterprise agent on Windows machines:

- From the Start menu, select LoadRunner > Advanced Settings > LoadRunner Enterprise Agent Configuration or run <LRE\_Installdir>\launch\_ service\bin\AgentConfig.exe.
- 2. In the Agent Configuration dialog box, select **Enable Firewall Agent**.
- 3. Click **Settings**. The Agent Configuration dialog box displays a list of settings.
- Set each option as described in "Agent configuration settings " on page 176.
   Pay careful attention to the first three settings.
- 5. Click **OK** to save your changes.
- 6. When prompted, click **OK** to restart the LoadRunner Enterprise agent.
- 7. Check the connection status between the LoadRunner Enterprise agent and the MI Listener.
  - a. Change the Agent Runtime settings to run as a process and check the status. For details, see "Run the LRE Agent as a process" on page 127.
  - b. If the status is OK, revert back to running it as a service. For details, see "Run the LRE Agent as a service" on page 128.

#### Notes:

- When you configure the LoadRunner Enterprise agent on Windows machines, the Remote Management agent is automatically configured with the same settings. The Remote Management agent enables you to manage remote machines from LoadRunner Enterprise Administration.
- After you have configured the LoadRunner Enterprise agent on the Load Generator machine, you can edit the configuration settings from LoadRunner Enterprise Administration. For details, see the Help Center.

# Configure the agent on Linux

Load Generator hosts can be installed on Linux machines. This section describes how to configure and run LoadRunner Enterprise agents on Linux machines.

**Note:** As part of the process of configuring the LoadRunner Enterprise Agent on Linux machines, you also need to configure the Remote Management agent. The Remote Management agent enables you to manage remote machines from LoadRunner Enterprise Administration.

#### To configure the LoadRunner Enterprise Agent on Linux machines:

- 1. Activate the firewall service for the LoadRunner Enterprise agent:
  - a. Open <LRE\_Installdir>/dat/br\_Inch\_server.cfg in a text editor.
  - b. In the **Firewall** section, set **FireWallServiceActive** to **1** and save your changes.
- 2. Activate the firewall service for the Remote Management agent:
  - a. Open <LRE\_Installdir>/al\_agent/dat/br\_Inch\_server.cfg in a text editor.
  - b. In the **Firewall** section, set **FireWallServiceActive** to **1** and save your changes.
- 3. Run **agent\_config** from the **<LRE\_Installdir>/bin** directory and enter the agent configuration settings (see "Agent configuration settings " on the next page).

**Note:** When you set the agent configuration settings, they are applied to both the LoadRunner Enterprise and Remote Management agents.

- 4. Restart the LoadRunner Enterprise agent for the configuration changes to take effect.
- 5. Restart the Remote Management agent for the configuration changes to take effect.
  - a. To stop the Remote Management agent, run the following command from the **<LRE\_Installdir>/al\_agent/bin** directory:

al\_daemon\_setup -remove

 b. To start the Remote Management agent, run the following command from the <LRE\_Installdir>/al\_agent/bin directory:

```
al_daemon_setup -install
```

# Agent configuration settings

The following table provides an explanation of the agent configuration settings: **Default** 

Setting	Value	Description
MI Listener name	none	The host name, fully qualified domain name, or IP address of the MI Listener.
Local Machine Key	none	A symbolic string identifier used to establish a unique connection between the Controller host and the agent machine, through the MI Listener machine.
		When configuring a Monitor Over Firewall agent, you can enter any logical name, using lowercase letters only.
		When configuring the agent on a load generator to run Vusers over a firewall, you must use the format hostname_locationname where:
		<ul> <li>hostname is the name of the host as found in LoadRunner Enterprise Administration's Hosts page.</li> </ul>
		<ul> <li>locationname is the name of the host location as found in LoadRunner Enterprise Administration's Host Locations page.</li> </ul>
Connection Timeout (seconds)	20 seconds	The length of time you want the agent to wait before retrying to connect to the MI Listener machine. If zero, the connection is kept open from the time the agent is run.

Setting	Default Value	Description
MI Listener User Name	none	The user name needed to connect to the MI Listener machine.
MI Listener Password	none	The password needed to connect to the MI Listener machine.
Server Domain	none	The domain name needed to connect to the MI Listener machine. This field is required only if NTLM is used.
Connection Type - TCP/HTTP	ТСР	Select either <b>TCP</b> or <b>HTTP</b> , depending on the configuration you are using.
Connection	none	If you select <b>HTTP</b> , configure the following:
Type - HTTP		• <b>Proxy Name.</b> The name of the proxy server. The proxy server must support HTTP tunneling using the CONNECT method. This field is mandatory if the <b>Connection Type</b> setting is <b>HTTP</b> .
		<ul> <li>Proxy Port. The proxy server connection port. This field is mandatory if the Connection Type setting is HTTP.</li> </ul>
		• <b>Proxy User Name/Password.</b> The credentials of a user with connection rights to the proxy server.
		<ul> <li>Proxy Domain. The user's domain if defined in the proxy server configuration. This option is required only if NTLM is used.</li> </ul>

Setting	Default Value	Description
Use Secure Connection (SSL)	inactive	Enable to connect using the TLS (formally SSL) protocol.
		When a proxy server is used, TLS is enabled by default and cannot be turned off.
		If you enable this option, enter the following information:
		<ul> <li>Check Server Certificates. Authenticates the TLS certificates that are sent by the server.</li> </ul>
		<ul> <li>Select Medium to verify that the server certificate is signed by a trusted Certification Authority.</li> </ul>
		<ul> <li>Select High to verify that the sender IP matches the certificate information. This setting is available only if Use Secure Connection is set to True.</li> </ul>
		• <b>Private Key Password.</b> The password that might be required during the TLS certificate authentication process. This option is relevant only if the <b>Client Certificate Owner</b> option is enabled.

## Check connectivity

To run Vusers or monitor servers over a firewall, you must be able to establish a connection between the LoadRunner Enterprise agent, MI Listener, and the Controller machine.

If you encounter connectivity problems after installing and configuring all the necessary components, check the table below for troubleshooting tips.

Check	Solution	
To check that the Firewall service was activated on the agent machine:	<ul> <li>Windows Installation: <ul> <li>Change the Agent Runtime settings to run as a process and check the status. For details, see "Run the LRE Agent as a process" on page 127.</li> <li>If the status is OK, revert back to running it as a service. For details, see "Run the LRE Agent as a service" on page 128.</li> <li>Otherwise, you need to reconfigure the LoadRunner Enterprise Agent on your Windows machine. For details, see "Configure the agent on Windows" on page 173.</li> </ul> </li> <li>Linux Installation: <ul> <li>In the temporary directory of the LoadRunner Enterprise Agent machine, locate the <li>local_machine_key&gt;_</li> <li>connected_to_MI_Listener file. If the file is missing, this indicates that the FirewallServiceActive=1 is not set in the [FireWall] section of the Agent Settings. For details, see "Configure the agent on Linux" on page 175.</li> </li></ul></li></ul>	
To check that port 443 is open:	On the agent machine, open a command prompt window, and type the following: telnet <mi_listener_ip> 443. <b>Example:</b> telnet 111.111.1111 443 If port 443 is open, a new Telnet window opens. If port 443 is not open, contact your network administrator.</mi_listener_ip>	
To check that port 443 is available:	If a web server is running on the MI Listener or Monitor Over Firewall machine, port 443 does not allow the access required by the listening and monitoring processes. Contact your network administrator to change the web server port.	

Check	Solution
To check connectivity between the agent and the MI Listener, when running the LoadRunner Enterprise Agent as a service:	When running the LoadRunner Enterprise Agent as a service, do the following:
	<ul> <li>Check that port 443 is open. See "To check that port 443 is open: " on the previous page.</li> </ul>
	<ul> <li>Check that the Agent Settings and Agent Configuration are correctly set. For details, see "Configure agents over the firewall - workflow" on page 173.</li> </ul>
	<ul> <li>Run the agent as a process by launching         <ul> <li><installdir>\Launch_service\bin\magentproc.exe.</installdir></li> <li>If you are successful, this indicates an authentication issue with the LoadRunner Agent Service.</li> <li>Browse to the</li> </ul> </li> <li>Administrative Tools &gt; Services &gt; LoadRunner Agent         <ul> <li>Service and change the properties of this service to System             User Account, or provide the username and password of a             user who has administrative permissions on this machine.</li> </ul> </li> </ul>
## Installation issues

This chapter provides troubleshooting for issues that arise when installing LoadRunner Enterprise components.

Problem	Troubleshooting				
LRE uninstall fails or freezes	This error can occur if LRE uninstall does not complete successfully, takes a long time and seems to have frozen, or if LoadRunner Enterprise is not found in Add/Remove Programs.				
	<ul> <li>Reboot the machine and uninstall again (unless LRE no longer appears in Add/Remove Programs).</li> </ul>				
	Alternatively, you can:				
	a. Open a command prompt and run:				
	<lre_host_installdir>\bin\HP.PC.PCS.Configurator.exe /CFG:\dat\setup\lts\xml\Configurator.xml /G:Uninstall</lre_host_installdir>				
	b. Delete LoadRunner Enterprise Host from the Start menu.				
	c. Open the Windows Installer CleanUp Utility and delete the product from the MSI manager. Refer to the product documentation for more details.				
Unable to run the setup LRE server or	To run <b>setup.exe</b> from a network location, you need to add the network server location to your Trusted Sites, and then run setup.exe again.				
host installation from a network drive	To add the network server to your Trusted Sites:				
	<ol> <li>In the Control Panel, select Internet Options &gt; Security.</li> </ol>				
	2. Click Trusted Sites and then click the Sites button.				
	3. In the Trusted Sites dialog box, add the location of the network server where the LRE component setup file is located, to the list of trusted sites.				
Unable to install LRE components from the installation directory	1. Make sure the user running the installation has sufficient permissions to launch executable files.				
	2. Restart the machine and try again.				
Unable to install a LRE component if the default port is in use	If the installation cannot use a default port because it is already in use, change the port as per the instructions described in "Unable to install a LRE component if the default port is in use" above.				

Problem	Troubleshooting			
Unable to install Network Virtualization (NV) components	Windows SmartScreen prevents <b>NVinstaller.exe</b> from running and installing NV Components.			
	<ol> <li>Before proceeding with the NV installation, open HKEY_LOCAL_ MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Explorer in the Registry Editor.</li> </ol>			
	<ol> <li>Change the Value data for SmartScreenEnabled to "Off" to deactivate Windows SmartScreen.</li> </ol>			
Host silent installation stops after installing .NET Framework 4.8	.NET Framework 4.8 replaces the .NET Framework 4.6.2 and earlier files. If there are any applications that are using the .NET Framework 4.6.2 or earlier files and are running during the installation of .NET Framework 4.8, you may need to restart your machine.			
	If you are prompted to restart the machine, restart it before continuing the installation. Refer to the product documentation for more details.			
A new user profile is created each	Each time LRE is installed , a new user profile is created, even if LRE was installed using a user profile that already exists.			
time LRE is installed	To manually delete a user profile:			
	1. From the Control Panel, open Advanced System settings.			
	2. In the User Profiles section, select Settings.			
	<ol> <li>Select the profile that you want to remove from the list of user profiles and click <b>Delete</b>. You might need to restart the machine to see that the profiles have been deleted.</li> </ol>			

## **Configuration issues**

This chapter provides troubleshooting for issues that arise during initial LoadRunner Enterprise configuration.

Problem	Troubleshooting				
LRE Server and/or host configuration	LRE Server and/or host configuration fails with the following error: "Failed to configure user. Error: System.Runtime.InteropServices.COMException: The network path was not found."				
fails	To complete the configuration successfully:				
	<ol> <li>Open the HP.Software.HPX.ConfigurationWizard.exe file located in the <lre_ installdir\LREConfiguratorWizard\ folder.</lre_ </li> </ol>				
	2. Go to the <b><appsettings></appsettings></b> section, and add the following:				
	<configuration> <appsettings>  <add key="SkipActionsException" value="AddUserToGroupStep"></add> <add key="SkipTestActionsException" value="AddUserToGroupStep" /&gt; </add </appsettings>  </configuration>				
Unable to configure LRE server or host when the process is used by another process	After running the LRE Server Configuration wizard, the following error is displayed in the log file: "The process cannot access the file 'C:\Windows\Microsoft.NET\Framework\v4.0.30319\config\machine.config' because it is being used by another process." This problem occurs when the configuration updates the .NET machine.config file while it is in use by another process (for example, IIS). When the file is in use, the update fails. Restart the machine and start the LRE Server Configuration wizard.				

#### Problem Troubleshooting LRE This problem occurs if the influxdb.exe process and the LRE Host Configuration configuration wizard are running at the same time. host fails to Make sure the **influxdb.exe** process is not running before you run the LRE Host start the Configuration wizard. LoadRunner Center Data Service LRE service Increase the global timeout for the service startup in the Windows registry. By default, the timeout is 30000 milliseconds and the registry value does not exist. fails to start after 1. Open HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control in the successfully Registry Editor. configuring 2. Add a new DWORD value (name it ServicesPipeTimeout), set Base to the LRE Decimal, and enter a value of 60000 (equivalent to 60 seconds). server × Edit DWORD (32-bit) Value Value name: ServicesPipeTimeout Value data: Base Hexadecimal 60000 Decimal Cancel OK

## Installation Guide

#### Troubleshooting

Problem	Troubleshooting				
Configure LRE to work	For requests over HTTPS only, you need to configure LRE to work with secure cookies over a secure connection.				
with secure cookies over	Set secure cookies on LRE web pages:				
a secure	1. Log onto the LRE server machine.				
connection	<ol><li>Open the <lre_server_installdir>\PCWEB\web.config file for editing.</lre_server_installdir></li></ol>				
	<ol><li>Search for 'requireSSL' in the file (there should be two occurrences), and set the requireSSL attribute to true.</li></ol>				
	4. Save the file.				
	<ol> <li>Open the <lre_server_ installdir&gt;\PCWEB\bin\HP.PC.Web.UI.UserSite.dll.config file for editing and repeat steps 3 and 4.</lre_server_ </li> </ol>				
	6. Repeat steps 1-5 for each LRE in the same environment.				
	Set secure cookies on LRE Administration web pages				
	1. Log onto the LRE server machine.				
	2. Open the <lre_server_installdir>\PCWEB_ADMIN\web.config file for editing.</lre_server_installdir>				
	3. Search for the section 'httpCookies'.				
	<ul> <li>If it exists, set the value of the requireSSL attribute to true.</li> </ul>				
	<ul> <li>If the section does not exist, add the following element under the <system.web> XML element:</system.web></li> </ul>				
	<httpcookies httponlycookies="true" requiressl="true"></httpcookies>				
	4. Save the file.				
	5. Repeat steps 1-4 for each LRE server in the same environment.				
	<b>Note:</b> You may be exposing the system to increased security risks if you do not set the <b>requireSSL</b> cookie configuration.				

## Configure LRE server to work with Windows Firewall

Process / Service	Direction	Protocol	Local Port	Remote Port	Path
World Wide Web Service (HTTP Traffic-In)	Inbound	ТСР	80	Any	Service
LoadRunner Remote Management Agent Service	Inbound	ТСР	3333	Any	<lre_server_ installdir&gt;\al_agent\bin \alagentservice.exe</lre_server_ 

Process / Service	Direction	Protocol	Local Port	Remote Port	Path
ALWrapperServer.exe	Outbound	ТСР	Any	54245	<lre_server_ installdir&gt;\bin \ALWrapperServer.exe</lre_server_ 
LRECoreAPI.exe	Outbound	ТСР	Any	Default ports: 1433 (MS SQL), 1521 (Oracle), 5432 (PostgreSQL)	
w3wp.exe	Outbound	ТСР	Any	8080, 8731, 3333	
		HTTP	Any	8086	

#### Configure LRE host to work with Windows Firewall

Process / Service	Direction	Protocol	Local Port	Remote Port	Path
Datacollectionagent.exe	Inbound	ТСР	3333	Any	<lre_host_installdir>\bin \datacollectionagent.exe</lre_host_installdir>
LoadRunner Remote Management Agent Service	Inbound	ТСР	54245	Any	<lre_host_installdir> \al_agent\bin \alagentservice.exe</lre_host_installdir>
LoadRunner Agent Service	Inbound	ТСР	54345, 50500	Any	<lre_host_installdir>\ launch_ service \bin\magentservice.exe</lre_host_installdir>
System	Inbound	ТСР	8731	Any	
Influxdb.exe	Inbound	HTTP	8086	Any	<lre_host_ installdir&gt;\bin\influxdb\Influxdb.exe</lre_host_ 
LTOPSvc.exe	Outbound	ТСР	Any	80, 8080	<lre_host_ installdir&gt;\LTOPbin\LTOPSvc.exe</lre_host_ 

#### Change LRE component port when default port in use

Component	How to change the port
LRE Server IIS	To change this port, refer to the product documentation.

### Installation Guide

Component	How to change the port
LRE host	To change port 8731 to a different port:
	<ol> <li>On each LoadRunner Enterprise host, open LTOPSvc.exe.config located in <lre_host_ installdir&gt;\bin\LTOPbin\ and change all four occurrences of 8731 to a new port number. Restart the LoadRunner Load Testing Service.</lre_host_ </li> </ol>
	<ol> <li>On the LoadRunner Enterprise server, open pcs.config (located in <lre_server_installdir>\dat\). Under PCSSettings, change ItopPortNumber to the new port number.</lre_server_installdir></li> </ol>

Component	How to change the port
MI Listener	To change port 443 to a different port, perform the following steps on the following machines:
	MI Listener or Controller machine if used as MI Listener:
	<ol> <li>Open <component_installdir>\launch_ service\dat\mdrv.dat, and locate the [launcher] section.</component_installdir></li> </ol>
	2. Add <b>OFWPort=<port></port></b> , where <port> is the new port number.</port>
	3. Go to <component_installdir>\launch_service\dat\channel_ configure.dat and locate the [General] section.</component_installdir>
	<ol><li>Add OFWPort=<port>, where <port> is the new port number.</port></port></li></ol>
	5. Restart the agent.
	Windows OneLG machine:
	<ol> <li>Open C:\Program Files (x86)\OpenText\LoadRunner</li> <li>OneLG\config\m_agent_attribs.cfg, and add</li> <li>ServerPort=<port> to the Agent section.</port></li> </ol>
	2. Restart the LoadRunner Agent service.
	Linux OneLG machine:
	<ol> <li>Open the \$M_LROOT/config/.mercury/m_agent_attribs_ <hostname>.cfg file, and add ServerPort=<port> to the Agent section.</port></hostname></li> </ol>
	2. Restart the daemon:
	./m_daemon_setup -remove
	/m_daemon_setup -install
	MOFW machine:
	<ol> <li>Open C:\Program Files (x86)\OpenText\Monitors Over Firewall\config\m_agent_attribs.cfg, and add ServerPort=<port> to the Agent section.</port></li> </ol>
	2. Restart the LoadRunner Agent service.
	Note: There is no support for changing port 50500.

Component	How to change the port
LoadRunner Agent	Changing the port for a Controller machine:
	1. Stop 'LoadRunner Agent Service'.
	2. Open for editing the file: <installdir>\dat\merc_agent.cfg</installdir>
	<ol> <li>Under the [Attributes] section, add the line: "AgentPort=<new Port Value&gt;"</new </li> </ol>
	4. Restart the service.
	Changing the port for a Load Generator machine:
	1. Stop 'LoadRunner Agent Service'.
	<ol> <li>Open for editing the file: <installdir>\launch_service\dat\merc_ agent.cfg</installdir></li> </ol>
	<ol> <li>Under the [Attributes] section, add the line: "AgentPort=<new Port Value&gt;"</new </li> </ol>
	4. Restart the service.
Autolab Agent (RemoteManagementAgent)	This service is used to perform administration tasks on all LoadRunner Enterprise machines. By default, Autolab Agent is using port 54245. The port number can be changed. However, the new value must be configured on each machine (server, host, Load Generator).
	To change the port:
	1. Stop 'RemoteManagementAgent'.
	2. Open <installdir>\launch_service\al_agent\dat\merc_agent.cfg</installdir>
	<ol> <li>Under the [Attributes] section, add the line: "AgentPort=<new Port Value&gt;"</new </li> </ol>
	4. Restart the service.
SiteScope (Monitor Profiles)	In LoadRunner Enterprise, change the port of the Monitor Profile entity to the same port as that defined during the SiteScope configuration.

## Login and other issues

This chapter provides troubleshooting for issues that arise after installing and configuring LoadRunner Enterprise components.

Problem	Troubleshooting
Unable to log in to LRE via the client machine	If you encounter "JavaScript is not installed or is disabled in your browser" error, this problem is related to running JavaScript in your browser.
	To resolve this issue:
	<ol> <li>In the Control Panel, select Internet options &gt; Security.</li> </ol>
	2. Select Internet zone and click Custom Level.
	3. Make sure that <b>Active Scripting</b> is enabled.
	4. Enable the following items under ActiveX controls and Plug-ins:
	<ul> <li>Automatic prompting for ActiveX controls</li> </ul>
	Binary and script behaviors
	<ul> <li>Run ActiveX controls and plugins</li> </ul>
	<ul> <li>Script ActiveX controls marked safe for scripting</li> </ul>
Unable to log on to the database server	If you receive the following error message "Problem encountered when application tried to connect to database.", verify that the database server host name, type, username, and password are correct. Consult your database administrator if you are unsure.
LRE does not work on non-default ports in Microsoft SQL	The Microsoft SQL instance must use a static port. The correct port must be defined in the connection string.
Initializing Run page does not load when starting a test run	The client machine needs to have access to the machine. For example, if the Administrator inserted the machine name without the domain, you might need to add the IP address and machine name to the host file (C:\WINDOWS\system32\drivers\etc\hosts) on the client machine.
No error message when a performance test fails to start	This problem is possibly caused by the configuration process. Validate the following:
	• The LoadRunner Load Testing Service in running on the host machine under the system account.
	The LRE user (IUSR_METRO) exists.
	<ul> <li>On LRE host machines designated as Controllers, open the folder <lre_ host_installdir&gt;\config. Open wlrun7.ini in a text editor, and make sure that lsOrchid and lsOrchid10 are both set to 1.</lre_ </li> </ul>

Problem	Troubleshooting				
LRE information is displayed in IIS and ASP.NET response headers	To prevent LRE information being disclosed in the IIS and ASP.NET response headers, we recommend removing the server- and version-specific headers from the default Web site, or any other site that was used for the LRE installation.				
	If using IIS 10.0 or later:				
	1. Open IIS Mana	. Open IIS Manager.			
	2. Select the serv	Select the server in Connection tree view.			
	3. Expand Sites,	Expand Sites, and select Default Web Site.			
	4. Open the Con	. Open the Configuration Editor User Interface module, and in the			
	Section combo box, select				
	system.webServer/security/requestFiltering.				
	S. Problem	Troubleshooting		
Default monitor measurements aren't displayed in online graphs when using OneLG hosts	This occurs when LRE is configured with a local user.		
	Create a user account on OneLG hosts with the same credentials and permissions as the LRE account.		
	For example, if you used the default local user (IUSR_METRO) on LRE servers and hosts, create the IUSR_METRO user and add it to the Administrators group on the OneLG machine.		
Incorrect time range displayed in online graph	Changing the time zone on the LRE Server or any external analysis database, results in the incorrect time range being displayed when running a performance test in the online graph.		
	To ensure the correct time range for running the performance test is displayed in the online graph, verify the time zone is synchronized on the LRE Server and any external analysis database servers.		
Working with LRE when Windows Firewall is enabled	When working with LRE, we recommend deactivating the Windows Firewall on all LRE server and host machines in the system, except for SiteScope.		
	If you are using LRE with Windows Firewall enabled, the Windows Firewall must be reconfigured to allow inbound and outbound communication on specific ports used by LRE. For details, "Configure LRE server to work with Windows Firewall" on page 186.
