## Upgrade

This document describes how to upgrade an existing installation of an on-premises ALM Octane server on Linux.

In this topic:

- "Upgrade paths" below
- "Prepare for upgrade" on the next page
- "Step 1: Deploy the new version and start ALM Octane" on page 6
- "Step 2: Upgrade cluster nodes" on page 7
- "Step 3: Upgrade spaces in ALM Octane" on page 7
- "Step 4: Verify that spaces upgraded successfully" on page 8
- "Step 5: Stop all ALM Octane servers" on page 8
- "Step 6: Restart the ALM Octane servers" on page 8

## Upgrade paths

ALM Octane allows you to choose between two upgrade paths:

- Short-term path (STP). Upgrade to each new service pack (for example, from 16.0.100 to 16.0.200). If you choose this path, you will need to go through all the interim service packs in order to upgrade to the following release.
- Long-term path (LTP). Upgrade directly from one release to the next (for example from 15.1.20 to 16.0.100, to the next LTP release), without having to upgrade to each of the interim service packs.

The current version is a service pack, meaning that you can only upgrade to 16.0.200 from 16.0.100. If you have not yet upgraded to ALM Octane 16.0.100, upgrade now.

## Prepare for upgrade

Before upgrading, review the following:

1. Check that all spaces are up to date, first in Settings > Site > Spaces, and then in Settings > Site > POST UPGRADE JOBS. Delete any spaces that you do not want to upgrade to prevent problems in future upgrades.
2. Verify that your server machine, and if relevant, all cluster nodes, meet all prerequisites.

This includes checking the supported versions for all third party tools and upgrading accordingly.
For details, see "Prerequisites" in the ALM Octane Installation Guide for Linux.
3. Stop the octane service on the server, and if relevant, on all cluster nodes.
4. Create backups of:

- The repository
- Existing ALM Octane configuration files, including octane.conf
- Your database
- Elasticsearch
- If you are using ALM Octane Synchronizer, back up :
- C:\octane\wrapper\wrapper.conf
- service.locator.properties (C:\octane\webapps)

For recommendations on making these backups, see Best practices for backing up ALM Octane data in the ALM Octane Help Center.
5. Take note of any special aspects of your configuration, such as:

| Special configuration | Recommendation |
| :--- | :--- |
| Did you use a different <br> user, other than the octane <br> user, to install? | If you did, the user is set in the OCTANE_USER environment <br> variable. Use this user to upgrade. |
| Did you install ALM <br> Octane to a location other <br> than /opt/octane? | Refer to the location you used while upgrading. |
| What sudoer user did you <br> use to install? | Use the same sudoer user that was used for installation to <br> upgrade. |
| Did your organization's <br> DBA make changes to <br> database schemas, such as <br> the addition of tables or <br> columns? | Define an exception file. The exception file instructs ALM Octane <br> to ignore manual changes to the database schemas during <br> installation. For details, see "Using exception files for manual <br> database changes" in the ALM Octane Installation Guide for <br> Linux. |

6. Before upgrading, remove all patches or hotfixes at WEB-INF/lib and WEB-INF/classes.

## Step 1: Deploy the new version and start ALM Octane

1. Download the ALM Octane RPM package:
https://www.microfocus.com/en-us/products/application-lifecycle-management-octane-onprem/download
2. Deploy the rpm package for the new version of ALM Octane using:
```
rpm -U <name of the RPM file>
```

3. Start the ALM Octane server.
```
systemctl start octane
```

4. Check the /opt/octane/log/wrapper.log file. If you encounter a recoverable error in the wrapper.log or upgrade.log files, fix the problem and restart the server to resume upgrade.

- If the log file contains the error message "The value https://<server URL> is invalid URL", refer to the section Upgrading non-standard top-level domains.
- The following is required if you configured trust on the ALM Octane server, when connecting to a remote location such as the database server. If your Java trust store (<java_ home>/jre/lib/security/cacerts) uses a non-default password, enter this password in octane.conf in the java-default-trust-store-password parameter.

[^0]
## Step 2: Upgrade cluster nodes

After the upgrade on the first node has completed successfully, you can upgrade the remaining nodes in a cluster.

## To upgrade cluster nodes:

1. Deploy the new version of ALM Octane to each node.
2. On each node, start the ALM Octane server.
```
systemctl start octane
```

3. Check the /opt/octane/log/wrapper.log file. If you do not see the "Server is ready!" message, correct the errors shown in the log.
If you encounter a recoverable error in the wrapper.log or upgrade.log files, fix the problem and restart the server to resume upgrade.

Caution: Do not use ALM Octane until you have completed "Step 3: Upgrade spaces in ALM Octane" below.

## Step 3: Upgrade spaces in ALM Octane

After upgrading, log into ALM Octane as the site admin to upgrade each space.

## To upgrade spaces in ALM Octane:

1. In a browser, navigate to <ServerURL>:<port>/ui?site.
2. Log in with the user name and password defined in the octane.conf file.

To upgrade all spaces at once, $\log$ in as the site admin.
3. Click Site and then click the Spaces tab.
4. Select one or more spaces and click Upgrade.

Upgrade is available only if the space needs to be upgraded.
5. Individual workspaces are upgraded in the background.

Note: Until all of the post-upgrade jobs have completed, some data may be unavailable in trend graphs and other Elasticsearch-related features.

## Step 4: Verify that spaces upgraded successfully

Verify that all spaces were upgraded successfully from the previous version. To verify that a space has been upgraded, check that:

- The space status is Active (or Inactive if it was previously deactivated).
- The space version is updated to the current version.

In addition, check that all post-upgrade jobs were completed in Settings > Site > POST UPGRADE JOBS.

## Step 5: Stop all ALM Octane servers

Clear caches by stopping all ALM Octane servers.

Note: All of the servers must be stopped before you restart any of them.

## Step 6: Restart the ALM Octane servers

After you stop all of the servers, you can restart them.

## Rollback

This section describes how to roll back after upgrading an on-premises ALM Octane server. This may be necessary if for some reason the upgrade fails or performance is slow.

Depending on when you want to roll back, there are different steps to perform.

Note: To roll back you need the pre-upgrade backups of all configuration files including octane.conf from each node.

In this topic:

- "After the upgrade's setup validation phase" below
- "After a site schema has been upgraded" below
- "After space schema has been upgraded" on the next page
- "After upgrade completed" on page 11
- "After upgrading cluster nodes" on page 11

## After the upgrade's setup validation phase

You can roll back after the upgrade's setup validation phase, whether it passed or failed.
If the upgrade reached setup validation, the following have been modified:

- Previously-deployed files
- ALM Octane configuration files, including octane.conf

## To roll back the deployed files, including octane.conf

1. Revert to the previous rpm file: rpm -Uvh --oldpackage <filename>
2. Revert to backups of ALM Octane configuration files, including octane.conf.
3. Start the ALM Octane server (the octane service).

## After a site schema has been upgraded

You can roll back after the site schema has been upgraded.
If the upgrade upgraded the site schema, the following has been modified:

- The site schema (database)
- Elasticsearch indexes
- ALM Octane configuration files, including octane.conf

## To roll back the site schema

1. Stop the ALM Octane server (the octane service).
2. Revert to a backup of the site schema.
3. Revert to a backup of Elasticsearch indexes.
4. Revert to the previous rpm file: rpm -Uvh --oldpackage <filename>
5. Revert to backups of ALM Octane configuration files, including octane.conf.
6. Start the ALM Octane server (the octane service).

## After space schema has been upgraded

If the upgrade upgraded the space schema, the following have been modified:

- Previously-deployed files
- Elasticsearch indexes
- ALM Octane configuration files, including octane.conf
- The site schema
- The space schema

Rolling back a single space is relevant after upgrade of a space failed. In this case, fixes are required depending on the cause of the failure, as seen in the logs and in the UI.

Note: This is only relevant if the space upgrade failed with CORRUPTED status. If it ended in SUSPENDED status, implement the fixes as instructed in the logs and in the UI, and then resume upgrade. No rollback actions are required.

## To roll back changes to the space schema:

1. Revert to the backup of the space schema.
2. Revert to the backups of Elasticsearch indexes related to the specific space.

Space-specific indexes can be identified by the space logical name embedded in their name, using the pattern mqm_\{space logical name\}_*.
Note: There are multiple Elasticsearch indexes for each space. Make sure to roll back all of them.
3. Revert to the repository backup of this specific space.
4. Fix what caused the upgrade to fail.
5. Run the following API to repair the space:

POST \{octane server\}/admin/shared_spaces/repair?ids=\{space_id\}
Tip: To repair multiple spaces, provide the space_ids separated by commas.
6. Upgrade again.

## After upgrade completed

If the upgrade completed successfully, the following have been modified:

- ALM Octane configuration files, including octane.conf
- The site schema
- The space schema(s)
- Elasticsearch indexes
- ALM Octane repository files

## To roll back the entire upgrade

1. Follow the procedure "To roll back the site schema" on the previous page.
2. Revert to backups of all space schemas.
3. Revert to backups of all Elasticsearch indexes.
4. Revert to backup of the previous repository.

## After upgrading cluster nodes

If you upgraded additional cluster nodes, the following has been modified on the cluster nodes:

- Previously-deployed files
- ALM Octane configuration files, including octane.conf

## To roll back to the rpm package

1. Revert to the previous rpm file on each cluster node: rpm -Uvh --oldpackage <filename>
2. Revert to backups of ALM Octane configuration files, including octane.conf.
3. Start the ALM Octane server (the octane service) on each cluster node.
